"A considerable portion of the iron that is used by the cupola furnaces of Philadelphia, besides that which is produced by the state, is the iron of New Jersey and other states, while the rolling-mills of Pittsburgh work large quantities of blooms from Ohio, Kentucky, and Virginia. The exact quantity of iron mined and smelted throughout the state has been pretty accurately ascertained by returns made by the county commissioners to the secretary of the commonwealth in 1839, by which it appears that there were mined in 699 townships that made returns 334,151 tons, and adding to that number the remaining 361 townships, according to the same ratio of production, there is in the 213 furnaces of the state the following quantity produced:—

	tons.
Iron ore mined in 699 townships	334,151
Estimated for the remaining 361 townships	172,573

Total 506,724

"It has been, moreover, estimated that the average amount of iron yielded by ore in the furnace is about thirty-seven and a half per cent, which produces one ton of metal to two and two-thirds of a ton of ore. To yield 190,000 tons of iron which is the estimated annual product of the state, requires 506,666 tons of iron ore. In order to exhibit in a tabular form the amount of the iron-works throughout the state, independent of the manufacture of iron, and their influence upon the measure of its industry, we subjoin the following table, prepared by a committee appointed to obtain statistical reports of the iron interests of Pennsylvania:—

NUMBER and Product of the Iron Works in Pennsylvania, in 1842.

NUMBER.	Product.	Number of Tons.	Value per Ton.	Aggregate Value.	Total Value.	Hands employed.
	tons.	tons.	dollars.	dollars.	dollars.	
22 rolling-mills, producing—						
Bar-iron		20,800	85	1,768,000		
Boiler-iron		2,400	110	264,000

Nails		8,960	110	985,600		
Nail-plate iron		2,400	90	216,000	3,389,600	1,678
51 forges, producing—						
Blooms	17,725					
Less—deduct blooms manufactured into boiler, sheet, nails, and nail plate	14,960					
		2,765	60	165,900		
Hammered bar		4,105	90	369,450	535,350	1,666
59 furnaces, producing—						
Castings		4,580	65	297,700		
Pig-iron	80,305					
Less—deduct 42,620 tons of bar-iron and blooms manufactured from pigs, allowing 25 cwt. of pigs to the ton, is	53,287	27,018	30	810,540	1,108,240	5,063
7 foundries, producing—		300	90		27,000	31
172 works—total pig-iron		74,528			5,060,190	8,438
131 furnaces, estimated produce	109,695					
Less—deduct manufactured into bars and blooms	32,262	76,433	30	pig-iron	2,292,990	6,856
84 forges, rolling-mills, &c., estimated to produce		27,410	75	bar and bloom	2,055,750	1,370
337 works in Pennsylvania, producing		178,371			9,408,930	16,664

"The largest amount of iron produced is in the counties of Northampton, Lehigh, Berks, Lancaster, York, Cumberland, Franklin, Bedford, Huntingdon, Centre, Columbia, Armstrong, Clarion, and Venango, although, in other counties, a considerable quantity of this metal is yielded from furnaces and forges. There are air and cupola furnaces, rolling mills, steam-engine factories, nail factories, scythe and sickle factories, axe and edge tool factories, cutlery factories, factories for shovels, spades, and forks; gun factories, car, carriage, and waggon factories, plough factories, and sheet-iron factories. We here annex, from the journal of the coal and iron interests of Pennsylvania, a table, exhibiting the annual value of the manufactures of iron, based upon the amount produced in 1842:—

MANUFACTURES OF IRON.

	dollars.
87,244 tons made into bars, additional value	3,489,760
71,000 tons castings "	5,000,000
45,000 tons rolled iron "	1,937,339
Iron in 270 steam-engines "	700,000
7017 tons of nails "	253,110
Scythes and sickles "	15,000
Edge tools "	110,000
Cutlery "	25,000
Shovels, spades, and forks "	30,000
Guns "	185,074
Cars, and other vehicles "	900,000
Ploughs, iron "	107,000
Sheet iron manufactures "	100,000
Articles made by blacksmiths "	5,000,000
Total	21,254,133

CHAPTER IV.

PRODUCE OF THE FOREST AND TIMBER TRADE.

THE forests of the United States are still of great extent,—but the export of timber is unimportant, with the exception of oak staves to Europe and the West Indies,—and of fir *scantling* and lumber, or beams, rafters, and posts, and shingles to the West Indies. The middle, and some of the southern states, are supplied to a great extent with fir timber, deals, and boards, from the state of Maine, especially from Bangor, and from New Brunswick. Since the time that high differential duties have been in force in favour of the British North American colonies, the importation into the United Kingdom has been of trifling amount. This circumstance has not been injurious to the United States,—while the fallacious encouragement given to the timber trade of British America has been of the most pernicious tendency, and has not only retarded the agriculture and prosperity of the latter, but it is remarkable that the North American timber has, with but very rare exceptions, involved in ruin those who have been engaged in it. The exceptions are where large capitalists have been enabled to take advantage of purchasing, at often less than half or a quarter of the original cost, the effects of the ruined timber merchant, or *lumberer*.

We have, in describing the timber trade generally, remarked that the Canadas were settled with a population of more than 250,000 independent farmers before the timber trade acquired any importance, that Nova Scotia, New Brunswick, and Prince Edward Island, were all settled with industrious agriculturists, who in general become independent farmers without having recourse to the timber trade.

There are also circumstances which have resulted from the colonial timber trade of a very different character; there are facts to be found in the registry offices for land, and in the recorded judgments of the courts of law, in Canada, in New Brunswick, in Nova Scotia, in Prince Edward Island, and in Cape Breton.

These documents and records we have had examined, and they have unfolded the undeniable, and certainly not satisfactory, facts; viz., that the numerous mortgages upon the lands of the farmers, who had by agricultural industry become generally independent, and the mortgages on the lands of others; and most of the judgments of the courts of law, in actions for debt, and the consequent sheriff's sales of lands, have been the results of the farmers and other possessors of land engaging in the *protected timber and ship-building trade*. We know that many who were previously in a state of independent opulence, and who afterwards lost their farms and property, have been utterly ruined by the allurements held out by the timber and ship-building trade. The few large houses which have accumulated large properties in the colonial timber trade consist scarcely of a fraction of the colonists, or of the truly colonial interests. The colonial agriculturists who left their farms to cut timber, or to engage in ship-building, were generally supplied on credit with goods and provisions at high prices: they received nominally high wages for their labour, but as they almost invariably got into debt, and were compelled to mortgage or sell their farms, it is conclusive that the real wages of their labour was below a remunerating amount. The farmers, on the other hand, who applied their industry to clearing their lands and to agriculture alone, were, at the same time that they were making sure yearly gains, transforming their woodlands into valuable arable and pasturage estates.

Several wood-cutters form what is termed a "lumbering party," composed of persons who are all either hired by a master lumberer, who pays them wages and finds them in provisions, or of individuals who enter into an understanding with each other, to have a joint interest in the proceeds of their labour. The necessary supplies of provisions, clothing, &c., are generally obtained from the merchants on credit in consideration of receiving the timber, which the lumberers are to bring down the rivers the following summer. The stock deemed requisite for a "lumbering party," consists of axes, a cross-cut saw, cooking utensils, a cask of rum, tobacco and pipes; a sufficient quantity of biscuit, pork, beef, and fish, peas and pearl barley for soup, with a cask of molasses to sweeten a decoction usually made of shrubs, or of the tops of the hemlock tree, and taken as tea. Two or three yokes of oxen, with sufficient hay to feed them, are also required to haul the timber out of the woods.*

When thus prepared, these people proceed up the rivers, with the provisions,

* The quantity of stock is, of course, greater or less, according to the number who compose the party. Some of the Canada lumberers carry an enormous stock to the woods.

&c., to the place fixed on for their winter establishment, which is selected as near a stream of water as possible. They commence by clearing away a few of the surrounding trees, and building a chanty, or camp of round logs, the walls of which are seldom more than four or five feet high; the roof is covered with birch bark, or boards. A pit is dug under the camp to preserve any thing liable to injury from the frost.

The fire is either in the middle or at one end; the smoke goes out through the roof; hay, straw, or fir-branches, are spread across or along the whole length of this habitation, on which they all lie down together at night to sleep, with their feet next the fire.

When the fire gets low, he who first awakes, or feels cold, springs up, and throws on five or six billets, and in this way they manage to have a large fire all night.

One person is hired as cook, whose duty it is to have a breakfast ready before daylight; at which time all the party rise, when each takes his "morning," or the indispensable dram of raw spirits, immediately before breakfast. This meal consists of bread, or occasionally potatoes, with boiled beef, pork, or fish, and tea sweetened with molasses; dinner is usually the same, with pea-soup in place of *tea*; and the supper resembles breakfast. These men are enormous eaters; and they also drink great quantities of rum, which they scarcely ever dilute. Immediately after breakfast, they divide into three *gangs*; one of which cuts down the trees, another hews them, and the third is employed with the oxen in hauling the timber, either to one general road leading to the banks of the nearest stream, or at once to the stream itself: fallen trees, and other impediments in the way of the oxen are cut away with an axe.

The whole winter is thus spent in unremitting labour. The snow covers the ground from two to three feet from the setting in of winter until April; and, in the middle of fir forests, often till the middle of May. When the snow begins to dissolve in April, the rivers swell, or, according to the lumberer's phrase, the "*freshets come down*." At this time, all the timber cut during winter is thrown into the water, and floated down until the river becomes sufficiently wide to make the whole into one or more rafts.

The construction of the vast masses of timber floated down the St. Lawrence and other great rivers of America, is nearly on all occasions similar, but bound proportionably stronger together, as the rafts increase in size. The raftsmen commence by floating twenty or more pieces of timber alongside each other, with the ends to form the fore-part of the raft brought in a line, and then bound close together by logs placed across these, and by binding one log to another with poles fastened down with withes plugged firmly into holes bored in the logs for the purpose. The size of the raft is increased in this manner by adding pieces of timber, one after another, with their unequal lengths crossing the *joints*, until the

whole lot of timber to be rafted is joined together, in one flat mass, on the river. The water at this period, is exceedingly cold; yet, for weeks together, the lumberers are in it from morning till night, and it is seldom less than a month and a half, from the time that floating the timber down the streams commences, until the rafts are delivered to the merchants.

No course of life can undermine the constitution more than that of a lumberer and raftsman. The winter, snow and frost, although severe, are nothing to endure in comparison to the extreme coldness of the snow-water of the freshets, in which the lumberer is, day after day, wet up to the middle, and often immersed from head to foot. The very vitals are thus chilled and sapped; the intense heat of the summer sun, a transition which almost immediately follows, must further weaken and reduce the whole frame, and premature old age is the inevitable fate of a lumberer. But notwithstanding all the toils of such a pursuit, those who once adopt the life of a lumberer prefer it to any other. They are, in a great measure, as independent, in their own way, as the Indians.

After selling and delivering up their rafts, they pass some weeks in idle indulgence, drinking, smoking, and *dashing off* in a long coat, flashy waistcoat and trousers, Wellington or Hessian boots, a handkerchief of many colours round the neck, a watch with a long tinsel chain and numberless brass seals, and an *umbrella*. Before winter they turn again to the woods, and resume the laborious pursuits of the preceding year. The greatest number of the lumberers and raftsmen, in Canada and New Brunswick, are from the United States. Many young men, of steady habits, in our colonies, join the lumbering parties for two or three years, for the express purpose of making money; and, after saving their earnings, purchase lands, on which they live very comfortably, by cultivating the soil, and by cutting down the timber trees for market.

We have, in describing New Hampshire, given some account of its early timber trade. Forests of various kinds of timber abound in Maine, especially in the recently ceded territory, and in the north and western frontiers of New Hampshire, New York, Pennsylvania, Virginia, and the Carolinas—Kentucky, Michigan, and other States. These we have described in the detailed accounts of each state.

The following table is condensed from the Official Returns made by Congress for 1840 :—

PRODUCTS of the Forests of the United States in 1840.

NAME OF STATE, &c.	Value of lum- ber produced.	Barrels of tar, pitch, turpen- tine, rosin.	Tons of pot and pearl ashes.	Skins and furs, value produced.	Ginseng, and all other pro- ductions of the forest— value.	Number of men employed.

Lumber of various kinds, naval stores (such as tar, pitch, turpentine, and rosin), pot and pearl ashes, skins and furs, ginseng, and oak bark, and other dyes, constitute what are usually called the products of the American forest. The term *lumber* comprises boards, plank, scantling, and *timber* for masts, spars, and buildings, and those of minor importance, as staves and heading, hoops and poles. In 1770, the official value of the different kinds of lumber exported from the United States, amounted to about 154,637*l.* sterling, or 686,588 dollars. From 1803 to 1807, the annual average value exceeded 2,500,000 dollars; and, from 1820 to 1830, it declined to about 1,784,000 dollars. Naval stores have long been an object with the Americans, not only for home consumption, but for exportation. Before they were produced in her North American possessions, England obtained her naval stores from the north of Europe, and, principally, from the pitch and tar company of Sweden.

About the year 1703, this company attempted to create a high monopoly price for tar, and other naval articles, by prohibiting their exportation, except in the ships of the company.

This attempt induced Great Britain to grant, by the 3rd and 4th Anne, a bounty of 4*l.* per ton on the importation of tar and pitch, and of 3*l.* per ton on the importation of rosin and turpentine, from the American colonies.

In 1770, the value of naval articles exported, from the American plantations, amounted to about 34,693*l.* sterling. In 1761, a society, instituted in London for the encouragement of arts, manufactures, and commerce, offered large premiums

to those who should import the greatest quantity of pot and pearl ashes from the North American colonies. Treatises, giving directions as to the mode of making them, were, about the same time, distributed among the colonists. In 1770, the value of these articles, exported from North America, was estimated at 64,660*l.* 9*s.* 2*d.* sterling.

Furs and skins have always constituted a portion of American exports. In 1770, the official value of furs exported, from all the North American colonies, including Canada, was 149,224*l.* 14*s.* 8*d.* sterling. From 1791 to 1803, the annual average value was about 300,000 dollars. A considerable proportion of the furs exported from the United States were brought from Canada. Ginseng, a root highly valued in China, has long been known in North America, and has become an export of considerable value. Oak and other bark and wood, for tanning and dyeing, have also become articles of export, of some value.

The Values of the Exports, the Produce of the Forest, from 1803 to 1844, has been as follows:—

YEARS.	Lumber of all kinds.	Naval stores.	Pot and Pearl ashes.	Furs and skins.	Ginseng.	Oak bark and other dyes.	Total value.
	dollars.	dollars.	dollars.	dollars.	dollars.	dollars.	dollars.

* For the nine months ending 30th of June only.

For exports of the products of the forests, from the United States to the British dominions, see Navigation and Trade between the United Kingdom and the United States hereafter.

CHAPTER V.

AGRICULTURE AND AGRICULTURAL PRODUCTS OF THE UNITED STATES.

THE agriculture of the United States of America is as variable as its climates. The following account of it we have grounded on the best practical American authorities, who generally deprecate the backward and slovenly condition of American husbandry; and upon our personal observations on the subject.*

We do not, however, generally agree with them, for we know many extensive districts in England, and on the continent of Europe, where far more ignorant and careless husbandry prevails than in the United States of America, or in the British North American possessions. In giving a brief statistical account of the agriculture of America, we must confine our limits, *first*, to the wheat and other grain-growing countries; *second*, to the countries where cotton, tobacco, rice, and sugar, are the staple crops.

Before the close of the revolutionary war, very little cotton and no sugar-cane were cultivated. As to the former depressed state of husbandry, and the progress of its improvement, we find some difference of opinion among the American writers on agriculture. "It is, indeed, a lamentable truth," says Mr. Watson, "that, for the most part, our knowledge and practice of agriculture, at the close of the revolutionary war, were in a state of demi-barbarism, with some solitary exceptions. The labours, I may say, of only three agricultural societies in America, at that epoch, conducted by ardent patriots, by philosophers, and gentlemen, in New York state, Philadelphia, and Boston, kept alive a spirit of inquiry, often resulting in useful and practical operations; and yet these measures did not reach the doors of practical farmers to any visible extent. Nor was their plan of organisation calculated to infuse a spirit of emulation, which county or state should excel in the honourable strife of competition in discoveries and improvements, in drawing from the soil the greatest quantum of net profits within a given space; at the same time, keeping the land in an improving condition, in reference to its native vigour. These results, and the renovation of lands exhausted by means of a barbarous course of husbandry, for nearly two centuries, are the cardinal points now in progression in our old settled countries, stimulated by the influence of agricultural societies. Nor did their measures produce any essential or extensive effects in the improvement of the breeds of

* Washington, considering the then state of agriculture in Europe, was a skilful agriculturist in America. Livingston, Powell, and Judge Buel, have been great benefactors. The reports of the latter—"American Husbandry," by Messrs. Willis Gaylord, and Luther Tucker, "The Cultivator," "The Genesee Farmer," "The Book of the United States," "The Official Returns to Congress," The Reports of Henry L. Ellsworth, Esq., The Reports of New York, Massachusetts, and other Agricultural Societies, "The Farmers' Instructor," by Judge Buel, "The Cultivation of Cotton," by Mr. Seabrook, President of the Agricultural Society of South Carolina; various private communications and personal observations, are our authorities for this account of the agriculture of the United States of America.

domestic animals ; much less in exciting to rival efforts the female portion of the community, in calling forth the active energies of our native resources in relation to household manufactures. The scene is now happily reversed in all directions. Perhaps there is no instance, in any age or country, where a whole nation has emerged, in so short a period, from such general depression, into such a rapid change in the several branches to which I have already alluded ; in some instances, it has been like the work of magic."

The early neglect of agriculture is traced to various causes. The first settlements were made along the shores of the ocean and bays, or on the banks of rivers. The population was scattered along the sea coast, where enterprise was directed, as the readiest means of employment to the fisheries and navigation. The cultivation of the soil was limited to the production of the necessities of life. Agriculture did not generally attract industry, though it was found far more certain than other pursuits. The more immediately lucrative pursuits of trade and navigation, were preferred to the more enduring labour of cultivating the soil, and, to the more distant time required to await its profits, or casualties.

When we, however, consider the formidable and disheartening difficulties that the wilds of America have presented, and, in the remote districts of America, still present to the new settler, we are not surprised at the slow, but at the comparatively rapid, progress of agriculture.

It is curious and interesting to observe the progress which a new settler makes in clearing and cultivating a wood farm, from the period he commences in the forests until he has reclaimed a sufficient quantity of land to enable him to follow the mode of cultivation which is practised in old agricultural countries. As the same course is, with little variation, followed by all new settlers in every part of America, the following description, which we drew from observation, may be useful to those who are about to emigrate.

The first object is to select the farm among such vacant lands as are most desirable ; and, after obtaining the necessary tenure, the settler commences (the nearest inhabitants usually assisting him) by cutting down the trees on the site of his intended habitation, and those growing on the ground immediately adjoining. This operation is performed with the axe, by cutting a notch on each side of the tree, about two feet above the ground, and rather more than half through on the side on which it is intended the tree should fall.

The trees are all felled in the same direction ; and, after lopping off the principal branches, cut into ten or fifteen feet lengths. On the spot on which his dwelling is to be erected, theseunks are all rolled away, and the smaller parts carried off or burnt.

The habitations which the new settlers first erect, are all nearly in the same style, and constructed in the rudest manner. Round logs, from fifteen to twenty feet long, without the least dressing, are laid horizontally over each other,

and notched in at the corners to allow them to come along the walls within about an inch of each other. One is first laid on each side to begin the walls, then one at each end, and the building is raised in this manner by a succession of logs crossing and binding each other at the corners, until seven or eight feet high. The seams are closed with moss or clay; three or four rafters are then raised to support the roof, which is covered with boards, or, with the rinds of birch or spruce trees, bound down with poles tied together with withes. A wooden frame work, placed on a foundation of stone, roughly dressed, is raised a few feet from the ground, and leading through the roof with its sides closed up with clay and straw kneaded together, forms the chimney. A space large enough for a door, and another for a window, is then cut through the walls; and, in the centre of the cabin, a square pit or cellar is dug, for the purpose of preserving potatoes or other vegetables during winter. Over this pit a floor of boards, or of logs hewn flat on the upper side, is laid, and another over head to form a sort of garret. When a door is hung, a window-sash with six, nine, or sometimes twelve panes of glass is fixed, a cupboard and two or three bed stocks put up; the habitation is then considered ready to receive the new settler and his family. Although such a dwelling has nothing attractive in its appearance, unless it be its rudeness, yet it is by no means so uncomfortable a lodging as the habitations of the poor peasantry in Ireland, and in some parts of England and Scotland. New settlers who have the means build much better houses at first, with two or more rooms; but the majority of emigrants live for a few years in habitations similar to the one here described; after which, a good comfortable house is built by all steady, industrious settlers.

When the occupant or first settler of new land or forest finds himself in comfortable circumstances, he builds what is styled a frame house, composed of timber, held together by tenons, mortices, and pins, and boarded, shingled, and clapboarded on the outside, and often painted white, sometimes red. Houses of this kind generally contain a dining-room and kitchen, and three or four bed-rooms on the same floor. They are rarely destitute of good cellars, which the nature of the climate renders almost indispensable. The farm-buildings consist of a barn, proportioned to the size of the farm, with stalls for horses and cows on each side, and a threshing-floor in the middle; and the more wealthy farmers add a cellar under the barn, a part of which receives the manure from the stalls, and another part serves as a store-room for roots, &c., for feeding stock. What is called a *corn-barn* is likewise very common, which is built exclusively for storing the ears of Indian corn. The sleepers of this building are generally set up four or five feet from the ground, on smooth stone posts or pillars, which rats, mice, or other vermin cannot ascend.

Previous to commencing the cultivation of woodlands, the trees which are cut down, lopped, and cut into lengths are, when the proper season arrives

(generally in May), set on fire, which consumes all the branches and small wood. The logs are then either piled in heaps and burnt, or rolled away for making a fence. Those who can afford it, use oxen to haul off the large unconsumed timber. The surface of the ground and the remaining wood is all black and charred; and working on it, and preparing the soil for seed, is as disagreeable, at first, as any labour in which a man can be engaged. Men, women, and children, must, however, employ themselves in gathering and burning the rubbish, and in such parts of labour as their respective strengths adapt them for. If the ground be intended for grain, it is generally sown without tillage over the surface, and the seed covered in with a hoe. By some a triangular harrow, which shortens labour, is used instead of the hoe, and drawn by oxen. Others break up the earth with a one-handed plough, the old Dutch plough, which has the share and coulter locked into each other, drawn also by oxen, while a man attends with an axe to cut the roots in its way. Little regard is paid, in this case, to make straight furrows, the object being no more than to break up the ground. With such rude preparation, however, three successive good crops are raised on fertile uplands without any manure; intervale lands, being fertilised by irrigation, never require any. Potatoes are planted (in new lands) in round hollows, scooped with the hoe four or five inches deep, and about forty in circumference, in which three or five sets are planted and covered over with a hoe. Indian corn, pumpkins, cucumbers, peas, and beans, are cultivated in new lands, in the same manner as potatoes. Grain of all kinds, turnips, hemp, flax, and grass seeds, are sown over the surface, and covered by means of a hoe, rake, or triangular harrow; wheat is usually sown on the same ground the year after potatoes, without any tillage, but merely covering the seed with a rake or harrow, and followed the third year by oats. Some farmers, and it is certainly a prudent plan, sow timothy and clover seed the second year, along with the wheat, and afterwards let the ground remain under grass, until the stumps of the trees can be easily got out, which usually requires three or four years. With a little additional labour, these obstructions to ploughing might be removed the second year, and there appears little difficulty in constructing a machine on the lever principle, that would readily remove them at once. The roots of beech, birch, and spruce, decay the soonest: those of pine and hemlock seem to require an age. After the stumps are removed from the soil, and those small natural hillocks called cradle hills, caused by the ground swelling near the roots of trees in consequence of their growth, are levelled, the plough may always be used, and the system of husbandry followed that is most approved of in England or Scotland. The foregoing remarks we drew up, from our observations on husbandry, in the counties north of Pennsylvania.

The following extracts on the subject of clearing lands is extracted from observations by Samuel Preston, of Stockport, Pennsylvania, a very observing cultivator. Previous to undertaking to clear land, Mr. Preston advises,—“1st.

Take a view of all large trees, and see which way they may be felled for the greatest number of small trees to be felled alongside or on them. After felling the large trees, only lop down their limbs ; but all such as are felled near them should be cut in suitable lengths for two men to roll and pile about the large trees, by which means they may be nearly all burned up, without cutting into lengths, or the expense of a strong team to draw them together. 2ndly. Fell all the other trees parallel, and cut them into suitable lengths, that they may be readily rolled together without a team, always cutting the largest trees first, that the smallest may be loose on the top, to feed the fires. 3rdly. On hill sides, fell the timber in a level direction ; then the logs will roll together but if the trees are felled down hill, all the logs must be turned round before they can be rolled, and there will be stumps in the way. 4thly. By following these directions, two men may readily heap and burn most of the timber without requiring any team ; and perhaps the brands and the remains of the log heaps may all be wanted to burn up the old fallen trees. After proceeding as directed, the ground would be clear for a team and sled to draw the remains of the heaps where they may be wanted round the old logs. Never attempt either to chop or draw a large log, until the size and weight are reduced by fire. The more fire-heaps there are made on the clearing the better, particularly about the old logs, where there is rotten wood.

“ The best time of the year to fell the timber, in a great measure, depends on the season’s being wet or dry. Most people prefer having it felled in the month of June, when the leaves are of full size. Then, by spreading the leaves and brush over the ground (for they should not be heaped), if there should be a very dry time the next May, fire may be turned through it, and will burn the leaves, limbs, and top of the ground, so that a very good crop of Indian corn and pumpkins may be raised among the logs by hoeing. After these crops come off, the land may be cleared and sowed late with rye and timothy grass, or with oats and timothy in the spring. If what is called a *good burn* cannot be had in May, keep the fire out until some very dry time in July or August ; then clear off the land, and sow wheat or rye and timothy, harrowing several times, both before and after sowing ; for, after the fire has been over the ground, the sod of timothy should be introduced as soon as the other crops will admit, to prevent briers, alders, fire-cherries, &c., from springing up from such seeds as were not consumed by the fire.

“ The timothy should stand four or five years, either for mowing or pasture, until the small roots of the forest trees are rotten ; then it may be ploughed ; and the best mode which I have observed, is to plough it very shallow in the autumn ; in the spring, cross-plough it deeper, harrow it well, and it will produce a first-rate crop of Indian corn and potatoes, and, the next season, the largest and best crop of flax that I have ever seen, and be in order to cultivate with any kinds of grain, or to lay down again with grass. These directions are to be understood as

applying to what are generally called *beech lands*, and the chopping may be done any time in the winter, when the snow is not too deep to cut low stumps, as the leaves are then on the ground. By leaving the brush spread abroad, I have known such winter choppings to burn as well in a dry time in August, as that which had been cut the summer before.”—*Encyclopedia Americana*.

Wherever a settlement is formed amidst the woodlands, and some progress is made in the clearing and cultivation of the soil, it begins gradually to develop the usual features of an American village. First, a saw mill, a grist mill, and a blacksmith's shop appear; then a school house, and a place of worship; and in a little time the village doctor, and pedlar with his wares, introduce themselves.

A saw mill, of itself, soon forms a settlement, for, attached to it, must be a blacksmith's forge, dwellings for carpenters, millwrights, and labourers, stables and ox houses. A shop and tavern are also sure to spring up close to it; tailors and shoemakers are also required.

In adverting to the circumstances which have retarded agricultural improvements in the United States, the following remarks occur in a very useful work, lately published on American husbandry,* “Coming, as the first colonists did, direct from the British Isles, and the intercourse with that country having continued, with only two slight interruptions, up to the present time, it follows, as a matter of course, that our modes of thinking and acting should be in a great degree fashioned by those of the fatherland. This is easily observable in our literature and our laws, and not less strikingly so in our agriculture. With some few modifications, then, such as may be traced to climate or the different social conditions of the two countries, the agriculture of the United States may be said to resemble that of England very closely.”

The above remark is the more strictly true as relating to the Atlantic States north of Carolina, to part of Vermont, and the portions of New York and Pennsylvania, west of the Alleghany mountains. We could apply them also to the agricultural districts of Nova Scotia, New Brunswick, Upper Canada, parts of Lower Canada, and especially to Prince Edward Island.

The authors of the work here quoted on American husbandry, proceed:—

“The question has been not unfrequently asked, How far are farmers in the United States justified in following the example and practices of British agriculturists? This question assumes an importance it would not otherwise possess, were it not a fact that we look with great interest to the results of agriculture in that country; that most of our standard agricultural works are from that side of the Atlantic; that the wealth and resources of England are such as to render that island a great theatre of experiments; and that the arts and the sciences which can be brought to bear on the cultivation of the soil, are far more extensively diffused and better understood there than here. Having the same Anglo-Saxon descent, the influence of England is felt in every department of our social condition; in our religion, literature, and laws; and, perhaps, is as potent as anywhere in the usages and practices that belong to the cultivation of the earth. In our implements used on the farm, we copy from English models; in improving our breeds of horses, sheep, and cattle, we look to stock imported from England; in our horticulture and floriculture we follow the

* “American Husbandry,” by Willis Gaylor and George Tucker, New York.

example of English planters and gardeners ; and in our farming operations, in culture, and in the selection of grains, the influence of that country is paramount. It is necessary, then, to inquire how far we may safely follow such an example, and in what respects we ought to deviate, or when it becomes necessary to do so.

"To determine this question correctly, it is necessary to take into consideration the position of the two countries, so far as regards climate, soil, and population, and their influence on plants and the prices of labour. In general, it may be laid down as a correct position, that the difference between the soils of the two countries is not of a kind to render any difference of culture important.

"To the turnip may be traced the great improvements made in raising cattle and sheep in Britain, as the vast amount of food thus produced from an acre enables the cultivator to enlarge his flocks or herds to any desirable extent, and, by rapid or comparative feeding, to exhibit their several qualities. In this country we have hardly begun to appreciate the value of the root-crop. Public-spirited and intelligent farmers have endeavoured to bring the subject to the notice of their fellow-tillers of the soil, but deep-rooted prejudices, and a dread of innovation, have in most instances made the effort up-hill work, and, as yet, productive of comparatively little effect. Still the ice has been broken ; an impression—a favourable one, we believe—has been made on public sentiment ; and when we remember that a long series of years was necessary to place the root-culture on a firm foundation in England, we see no reason to despair of a like triumph over incorrect notions and the production of similar benefits here.

"Population, by justifying, or, rather, compelling English farmers to adopt peculiar systems of farming, may be said to create a wider difference between the agriculture of the two countries than any arising from the soil.

"But it is to climate that the principal points of difference in the agriculture of the two countries must be traced ; and this is what should be kept most distinctly in view when comparisons between English agriculture and our own are instituted. England, though in the latitude, and most of it north of Quebec, has a milder climate than our middle states ; and this fact should not be lost sight of in adapting the agriculture of that country to this. In the United States (we speak particularly now of the northern and middle states, as it is these that are more influenced by English agriculture than the south), the summers are much hotter and the winters much colder than in England : hence some plants that require a great degree of heat will succeed better here than there ; while many plants will bear the winters of England in the open air, that perish when exposed without protection to the intense cold of our winter months. A great number of thermometrical observations show that the average temperature of the three months of January, February, and March, in England, is about 37 deg., 42 deg., and 47 deg., and that of the three months of June, July, and August, about 63 deg., 66 deg., and 65 deg. The average difference between the highest and the lowest temperature per month will not exceed more than 6 deg. or 8 deg., those sudden and extreme changes to which our climate is subject being unknown there. In the valley of the Genessee, near Lake Ontario, the average for the three winter months gives about 24 deg., 26 deg., and 36 deg., and for the three summer months, 71 deg., 73 deg., and 72 deg. ; the mean average of several years is 49 deg., and the range of the thermometer about 100 deg. In this country we have changes of from 30 deg. to 40 deg. in twenty-four hours : there the greatest rarely exceeds 6 deg. or 8 deg. There, also, the thermometer seldom descends but a few degrees below the freezing point, while here it is below for weeks or months together. Indeed, it is probable that, in the colder parts of the United States, the thermometer falls below zero as often as it does in England below 32 deg.

"This statement will show that there must be a material difference between the agricultural operations proper to two countries so situated, as far as those operations can be affected by climate. To give a single instance : Indian corn, it is ascertained, cannot be grown in any country where the thermometer for more than one month is not above 70 deg. ; and that in a temperature of 75 deg., or 80 deg., it arrives at its greatest perfection. This is the reason why, notwithstanding all the efforts made to introduce corn into Great Britain, it has proved a complete failure. It is not killed with the frost there as here ; but the degree of heat will not bring it to maturity during the summer months. Mr. Cobbett was

confident he should succeed, and did grow some tolerable crops of early Canadian ; but, like some trees which flourish and mature their seeds here, but will not ripen in England, the corn would not in all cases mature so as to vegetate, and, in spite of his boastings, he was compelled to abandon the culture. On the contrary, wheat is a crop that requires a lower temperature than maize, and is not adapted to a hot, dry climate. Great Britain is, therefore, one of the best wheat countries on the globe, and, perhaps, produces, in proportion to the land in tillage, a greater amount than any other. The low temperature and moist climate of England is found to agree with this plant perfectly. Scotland is too cold; but no part of the island is too hot, as is the case with a considerable portion of our southern states.

“ To this difference of climate must be attributed the difficulty we have found in the United States in growing hedges from such shrubs or trees as are used in England for this purpose. From witnessing their excellent effect and beautiful appearance there, it was perfectly natural that we should adopt the same plants for the same object here ; but, after the repeated and persevering efforts of fifty years, it may be questioned whether there are five miles of tolerable hedge, from imported varieties of thorn or holly plants, in the United States. The difference between the moist, temperate, and equable climate of England and the hot, dry, variable climate of this country, seems to have been overlooked ; when a recollection of this fact would have convinced any one acquainted with the physiology of plants that our seasons must be fatal to English hedges. Whether there are any of our native plants that will supply this desideratum, remains to be seen.

“ The worst effect which our variable climate and intense cold have on our agriculture, when compared with that of England, is their influence on our wheat crop. The heaving out of the roots of wheat and clover plants by the expansion of frost, and which is here the most fatal in the spring of the year, when the surface thaws by day and freezes by night, is something which agriculturists in that country are rarely called to guard against, and which, of course, never enters into their calculations in the preparation of their soil. Here it is advisable, in all cases, to guard against the evil by such a system of ploughing and manuring as shall most effectually obviate the danger arising from this source.

“ The causes which, in our opinion, have tended more than any others to depress agriculture, and prevent its receiving the attention it demands, as well as to reduce the profits which should reward the labourer, are the following : First, a want of respect in the agricultural interest for their own profession. There is a feeling in certain portions of the community (principally among those who have done nothing to increase the productive capital of the country themselves, and who may be termed the drones of the social compact), that personal labour is disgraceful, and that the cultivator of the soil is little better than a slave. Strange as it may seem, this feeling may be said to be promoted and perpetuated by the conduct of farmers themselves. There are too many men among us—men who have good farms, and who might employ their sons upon them, with the certainty that honourable competence would be the result—who prefer to see them exposed to the fluctuations and uncertainties of mercantile life, or involved in the temptations and perplexities of professional life, rather than honest, high-minded, intelligent cultivators of the soil. For this evil, and it is a serious one, the remedy is with the farmer. His sons should be well educated ; but they should be taught to feel, what in fact is the case, that in the actual dignity and usefulness of their profession, the farmer has few equals and no superior.*

* The following extract, written some years ago, will show that the evil complained of was not confined to the United States :—

“ The cultivation of the soil of Nova Scotia was long neglected for other pursuits ; it was even considered as disreputable, as if a portion of that spirit had been transplanted to the colony, which in Europe, during the feudal times, viewed husbandry as a degraded employment, in which villains or slaves should alone be engaged. A ridiculous pride certainly prevailed for a long time, and still, in some measure, exists in America, which showed itself by holding rural labour in contempt. This has been the principal cause of poverty among the old settlers, who, when any other employment offered, generally escaped from the occupation of husbandry.

“ Strange as it may appear in England, where such opinions will be laughed at, the petty shop-keeper, who retailed rum, sugar, and tea ; the pedlar who carried about tape, thread, needles, and pins ; the keeper of a common tavern, or dram-shop ; the constables who served the writs or

"The second cause of the depressed state of agriculture in the United States is the inattention of farmers in selecting the best breeds of animals for their yards, and the best seeds for planting. In these two respects there is the greatest room for improvement; and the necessity of entering at once upon a course of reform cannot be too earnestly pressed upon our cultivators.

"Another, and third cause of the low state of agriculture, is the too general want of knowledge among farmers of the scientific principles which govern it."

We have, in the account of each state, territory, and district of the United States, described the soil of each. In a general view of the agriculture of all, it may be interesting to class the whole country in regions, with regard to the soil and its productions.

The *first* of these regions comprise the six New England states; the *second*, New York, and the middle *Atlantic states*; the *third*, the northern Western states; the *fourth*, the Atlantic, or cotton and rice growing states; the *fifth*, the lower and southern Mississippi, or cotton and sugar growing states. With respect to the fertility and products of these regions, the following extracts, from an article on the agriculture of the United States, in "Hunt's Magazine," are interesting:—

"Taking the six states of New England, which are limited in their territory, we find, that although the soil is of primitive formation, and much broken by hills and ledges of rocks, the common grains, such as rye, corn, buckwheat, potatoes, and most of the garden vegetables, are produced upon its hill-sides and in its valleys to a considerable extent, which may be much increased by improved methods of culture, although a large portion of its surplus population is annually drained off to the more productive lands of the new states of the west. The state of Massachusetts, however, has exceeded all other of the New England states, in a better form of husbandry. There, not only has greater attention been paid to this interest as a science, but the influence of that improvement is experienced in the greater abundance and the superiority of its crops. Passing to the state of New York, we find the advantages furnished by the interest of agriculture most signally displayed. In that wide alluvial soil, stretching away from the banks of the Hudson to the shores of Lake Erie, the surface of the territory, throughout nearly its entire extent, is checkered with prosperous farms, tilled by an agricultural population which is probably exceeded by that of no other portion of the country, in the independence and solid comfort which they enjoy—a condition that is principally derived from the cultivation of the soil. In that condition, indeed, we perceive the benefits which might be diffused throughout the whole country, were this species of enterprise more widely extended. The production of wheat alone in this state yields a vast revenue to its producers; and the flour which is poured out from its mills, and the quantity of beef, pork, and other products of stock-husbandry, as

summons of the justice of peace, and the cheating horse-dealer; in short, all who made a living by scheming or rascality, considered themselves much more important persons than the truly more respectable, and assuredly more honest, man who cultivated his own lands.

"Unfortunately, many of the farmers themselves considered the cultivation of the soil so far beneath them, that they only held the plough from necessity, as a degraded employment, while their sons skulked from rural labour to the woods, or to seek for employment on board of the coasting vessels:—the daughters, also, were ashamed of being found engaged in the dairy, or assisting in the occupations of haymaking and harvest.

"Great, however, as the change and improvement in the agriculture of the province has been, we must yet consider farming, comparatively speaking, in a rude state.

"There still exists a lazy attachment to the make-shift system—an absence of neatness, amidst luxuriant vegetation. In short, the mere means of living are too easily obtained; and, when this is the case, the stimulus of improvement and the attainment of order seems to cease. Time, and a great increase of population, will alone create an effective change."—*M'Gregor's British America*, Vol. II.

well as grains and vegetables, which fill the channel of the Hudson, supply the wants of the villages upon its banks, and the great metropolis at its mouth. Passing towards the south, we reach the territory of Western Pennsylvania, cultivated with pains-taking thrift by Dutch farmers, a source of no inconsiderable wealth to the state. Arriving in Maryland, we enter upon a soil which, while it produces most of the grasses and grains of the north, in as great abundance as even the state of New York, yields also the tobacco; and, from that state, through Virginia, North Carolina, South Carolina, Georgia, and Florida, we have a territory which stretches away in plain and valley, inviting the labours of the plough, and giving, in return, not only the vegetable products of the north, but also those great staples, rice, tobacco, and cotton.

"Nor are the agricultural advantages of this portion of our territory, however great, equal to those furnished by the soil of the west. The valley of the Mississippi, or that domain which extends from the head of Lake Superior to New Orleans, watered by about 3000 miles of that great river, spreads out a more fertile territory than that of any other portion of the globe. The oak-lands, extending through Michigan to the borders of the lakes, the prairies of Illinois, the deep mould which stretches from the southern borders of the lakes beyond both banks of the Ohio, the forests of Kentucky, and the numerous states organised along the Mississippi, the Illinois, and the Missouri, from the rugged cliffs of Lake Superior to the cotton and sugar plantations of Louisiana and Alabama, develop a field for agriculture which almost bewilders us by its magnitude.

"The relative proportion of the agricultural production of the different states, may be clearly ascertained from the census which has been ordered, by act of Congress, to be taken. It would seem, that as a wheat-growing state, Ohio stands first in rank; the amount of that product which it yields being about 16,000,000 bushels. The next in importance is Pennsylvania, the annual product of which is 13,000,000 bushels. New York ranks the third, producing 11,000,000 bushels; and Virginia the fourth, producing 10,000,000 bushels. The state of Tennessee has yielded the largest annual crop of Indian corn; the product of that state being estimated at 42,000,000 bushels; Virginia has produced 34,000,000 bushels, Ohio 33,000,000 bushels, Indiana 28,000,000 bushels, Illinois 22,000,000 bushels, Alabama 18,000,000 bushels, Georgia 17,000,000 bushels, and Missouri 15,000,000 bushels. In the production of potatoes, New York seems to bear the palm, having yielded 30,999,000 bushels; next comes Maine, with a crop of 10,000,000 bushels; and she is followed by Pennsylvania, with 8,000,000 bushels. In the production of cotton, Mississippi leads the way with 289,000,000 lbs.; Alabama succeeds, with 240,000,000 lbs.; Georgia follows, with 148,000,000 lbs.; South Carolina comes afterwards, with 134,000,000 lbs.; Tennessee follows, with 128,000,000 lbs.; Louisiana yields 87,000,000 lbs.; Arkansas 23,000,000 lbs.; and Virginia 10,000,000 lbs. In the production of sugar, it would also appear that Louisiana has yielded the largest amount, having produced 249,000,000 lbs.; and New York comes next, in the manufacture of that which is derived from the maple, yielding, as we are informed, from her own forests, 70,000,000 lbs. In the production of swine, Tennessee stands first, having 2,795,000; while Ohio has furnished 2,000,000. In the production of wool, also, New York ranks first; and that state is soon followed in successive order by Ohio, Vermont, Pennsylvania, and Virginia. In the production of tobacco, the state of Tennessee, also, appears to rank first, yielding the amount of 26,000,000 lbs., Maryland is next, with 18,000,000 lbs., and Virginia, with 14,000,000 lbs., follows. In the production of lumber, also, New York has exceeded any other state, producing that article to the value of 3,788,000 dollars. This state is soon followed by Maine, the alleged valuation of whose lumber is 1,808,000 dollars. So, also, in the products of the orchard, the palm is given to New York; the value of this species of product derived from her soil being 1,732,000 dollars. In the products of the dairy, New York is found at the head of the column, producing from this source the value of 10,000,000 dollars; and that state is soon succeeded by Vermont, which derives, from the same source, the value of 4,892,000 dollars.

"It is, indeed, extraordinary, when we consider how certainly the application of science to the art of agriculture increases the amount and value of its products, and a proper attention to stock-husbandry improves the breed of cattle, that more attention is not paid to the subject in our own country. We have annual exhibitions of cattle, called fairs, in

which, it must be granted, that noble specimens of this species of stock are displayed ; but little has been done, compared with what ought to be done, when we reflect upon the magnitude and importance of our agricultural interest. There are many farmers, both at the east and west, who, with a laudable enterprise, have imported numerous valuable specimens of farming stock ; and we know that there are numerous agriculturists in the heart of Kentucky, Tennessee, and Ohio, upon a domain which we of the east are too apt to term a wilderness, who drive from their barn-yards specimens of sheep, horses, and cattle, which would surprise the less ambitious husbandmen of many of our eastern states. But notwithstanding the too great neglect of this branch of our agricultural interest, which we denominate stock-husbandry, our advance, in this respect, of late years, has been obvious and marked ; and this improvement is manifest to every one who will compare the quality of our sheep and cattle with those of the same general species which formerly existed in our own country. Liberal and enterprising gentlemen, adopting the pursuit of agriculture from taste and inclination, and disposed to spread widely the benefits of improved husbandry, have imported at their own expense, from abroad, some of the best species of horses and cattle. As early as 1802, the first importation of merino sheep into this country was made by Colonel Humphreys, of the state of Connecticut, and Chancellor Livingston, of New York. Several companies have been also formed in the states of Ohio and Kentucky, composed of gentlemen of fortune, who have made it an important object to import from Europe the best stock, both of cattle and sheep ; and the farming interest of the country is indebted to Messrs. George and Thomas Searle, of Boston, who, in 1824, imported that beautiful and valuable species of sheep, the Saxony, into the east, it having been introduced into the west seven years previously ; and to Van Rensselaer and Corning, of New York ; Powell, of Pennsylvania ; and Cushing, of Massachusetts, for similar services ; the last-named gentleman having not only imported the best stock, but distributed them among the farmers of his vicinity ; deriving, as the sole consideration, the conviction that he had conferred solid advantages upon the agricultural interest of the nation. There are other individuals who have performed similar services."

Great improvements are, however, making in the agricultural as well as in the rearing of live stock, and valuable information on the subject will be found in the Transactions of the New York and other Agricultural Societies, to which our limits will scarcely more than allow us to refer.

The following remarks on the crops of the United States are extracted chiefly from the Reports for 1843, of Henry L. Ellsworth, Esq., Commissioner of Patents, on the Improvements in Agriculture and the Arts, and the statistical tables are all arranged and condensed from voluminous official returns.

PROGRESS OF AGRICULTURAL IMPROVEMENT.

"The progress of improvement in agriculture, though gradual, is yet steady. The importance of this branch of industry is beginning to be more and more appreciated. The whole country is more or less interested in it, as it furnishes, besides what is consumed at home, at least three-fourths of all the exports of the United States.—The vast public domain of unsold lands, too, will be affected by this progress, and its value proportionably advanced. It may be well here to mention some of the principal sources of this improvement.

"*Causes of Improvement.*—The geological surveys ordered and in progress, or recently completed, in many of the states, besides the other important benefits thereby conferred on those states, have contributed much to advance the science of husbandry.

"These, in connexion with the experiments of agricultural chemistry, by thus directing the attention to their analysis, are developing the nature of the soils and their adaptation and means of increased production, by different seeds, products, and methods of cultivation and manures, and so enable the farmer or planter to use the varieties of his land to the best advantage.

"The increasing number of agricultural periodicals and treatises, and their cheap and

more extensive circulation throughout the land, are also producing a happy effect. The farmers and planters in the various sections of our country are thus brought acquainted with each other's operations and success, and also with the methods of cultivation and rearing of stock, &c., common in England and on the continent, new products and the result of their trial are noticed, and the knowledge of many useful discoveries thus extended. The prejudice against 'book farming,' as it has been termed, which has so long proved a barrier to the adoption of valuable improvements thus suggested, is gradually wearing away; and a happy combination of science and practical skill is thus secured, the results of which are every year becoming more and more apparent.

"Agricultural societies also exercise great influence in furthering the progress of agricultural industry. These are but of comparatively recent date, and their institutions and increase in number and prosperity serve to mark the progress of improvement in agriculture; and if still further aided by an efficient board of agriculture, like what exists in Great Britain, they would no doubt be yet more successful. It is only about fifty years since that board was there established, and it has proved of extensive benefit to that active empire. By means of these societies, great numbers of the agriculturists of our country are brought together, to compare notes, as it were, to observe each other's success, and to converse on the topics connected with this branch of industry. They examine the machines, implements, animals, and products, offered for exhibition, and are induced to bestow more care and labour in the selection of their seeds and stock, in the preparation of the soil, and in their tillage and harvesting.—Every year new and valuable improvements are thus made known and introduced, by which many are essentially benefited. Premiums also encourage to effort, and a highly salutary incentive is furnished, in the honour to be acquired of successful and approved farming. A similar effect, too, results from the bounties given by the different states to encourage the culture of some particular product. These have never been offered without a new impulse being stirred, and leading to increased attention to the pursuit. Some of the states in these respects are far in advance of others, but almost all are beginning more to appreciate their true interest, and seeking to extend their true prosperity.

"While adverting to the causes of general improvement in the agriculture of our country, it may not also be improper to allude to the increased habits of temperance and sobriety of the labourer, by which the condition of the farm-house and farm is so essentially benefited, and domestic happiness and effective strength promoted. A clear head and a vigorous frame, in combination, will ever be most successful in tillage, as in every branch of industry. The lengthening of life and the repair of health, thus secured, render many who have been but drones and mere consumers, also active and efficient producers, as well as healthful consumers. The amount added, too, in the increased skill, as well as the saving from less breakage of tools, machinery of labour, and the actual effectiveness of such labourers as have heretofore been drawn from the intemperate class, now reformed, constitute no small item of gain in this view of the subject. No little damage has been thus sustained in the 'inebriate' management and cultivation of the land, which is now avoided. Were this the proper place, some most interesting deductions might be made as to the physical force and efficiency thus added to the various branches of industry, and the bearing of the whole on agriculture, as a source of our national wealth."—*Mr. Ellsworth's Report.*

Live Stock.—The horses, horned cattle, swine, and sheep of the United States, though still of inferior breeds, have now very greatly improved. We have no space to give any lengthened account of the live stock of America; and those who wish to be well informed on the subject, will find ample descriptions in the Transactions of the New York State Agricultural and other Agricultural Societies.

New York, Virginia, Pennsylvania, the New England States, Michigan, and Vermont, and in time, the prairie regions, will be the principal countries for horses, horned cattle, and sheep. The swine of the western states are increasing rapidly, and of late years for salting, and especially for lard oil.—(See Pork and Lard Oil Trade hereafter.)

The breeding of sheep for their wool has been greatly increased and improved. The following extract on the subject is interesting :—

“From present experiments, the introduction and raising of sheep on the vast prairies of the west are to be anticipated, and it would not be surprising if there should be a great change in the territory to which the consumers of wool must look for much of their raw material. Hitherto, the New England and middle states have principally furnished the market with wool. But sheep are already beginning to acquire importance in the view of the farmers and the planters of the west and south; and if the importation of 1100 merino bucks in a single year into South America produced such a change in their flocks, why may not equally as striking a result be effected in the western and southern states by a similar introduction there? Millions of sheep could be sustained at little expense on the belt of the oak timber land running through Georgia, seventy miles wide by 150 miles long. Indeed, there is scarcely one of the southern states but would furnish some good section for the keeping of flocks on the up-lands. Planters are now also actually beginning to collect their flocks. The sheep-raising states of the north must expect competition. The farmer in the higher and colder latitudes, who has to fodder his flock for a long winter, will certainly feel the effect of this new direction of sheep husbandry, brought, as he will be, into competition with those who enjoy the advantage of an almost perennial spring. So soon as the planter ceases to be absorbed in the production of cotton, the streams of the south will be lined with mills, and various operations of machinery. The northern and middle states cannot but see that it will do so. There are many locations south and west of the Delaware where three sheep at least can be kept as cheap as one can on the confines of the Canadas.

“Pasturage to almost any extent covers the prairie range, and grass and grain for a short winter's feed are cut and reaped by machines at a trifling expense. One gentleman, it is stated, in the vicinity of Buffalo, New York, having a prairie farm in Illinois of some 500 acres, purchased 2000 sheep, which he placed upon it, under the care of two faithful shepherds. The sheep were kept without difficulty in the best of health, and the proprietor, as the first fruits of his enterprise, received 6000 lbs. of good wool, worth thirty cents per lb. The transportation from Illinois to Buffalo cost about one cent per lb. These facts are mentioned, not to discourage effort, but to prepare the producer of wool to meet the condition of things that must soon take place in a state of general peace and depression of price of all the staple products. By the last census it appears, that there are in the United States about 20,000,000 of sheep. It has been thought by those who have paid attention to this subject that this number is much too low; and the supposition has been made that there are not less than 34,000,000 of sheep in this whole country, of which one-fifth are in New York. The safer estimate would probably be about 25,000,000; the estimated value of which, at two dollars per head, would give 50,000,000 dollars. Three sheep is the general allowance per acre for winter provender and summer pasture. The aggregate quantity of land necessary is more than 8,330,000 acres; which, at the average of fifteen dollars per acre (perhaps it would reach even to twenty dollars), would be nearly 125,000,000 dollars. The amount of wool produced at an average of two lbs. the fleece is 50,000,000 lbs., which, probably, at the lowest average price, is equal to 12,000,000 dollars.”

The following are the live and dead weights, raised and fed by Mr. Raybold at his farm near Delaware city. Their wool was long, fine, and silky, such as is raised for the finest worsted stuffs.

Live weights each, 251 lbs. 200 lbs., 200 lbs. 219 lbs., 229 lbs. 233 lbs., 195 lbs. 219 lbs., 209 lbs. 173 lbs., 195 lbs. 195 lbs., 177 lbs. 205 lbs., 189 lbs. 209 lbs., 229 lbs. 183 lbs., 193 lbs. 203 lbs., 189 lbs.

Dead weights each, 116½ lbs. 115½ lbs., 124 lbs. 124 lbs., 110½ lbs. 100¼ lbs., 119 lbs. 94 lbs., 107 lbs. 105½ lbs., 128½ lbs. 111 lbs., 110½ lbs. 98 lbs., 130½ lbs. 117½ lbs., 132½ lbs. 147 lbs., 111½ lbs. 130 lbs., 118 lbs.

The rough fat weighed 371 lbs.

The following Tabular Statement will exhibit the Live Stock and Products of each State.

TABLES exhibiting the Live Stock, Horticultural, and Agricultural Products of the United States, from the Official Returns made by the Marshals, in 1840.

NAME OF STATE.	LIVE STOCK.					HORTICULTURE.					
	Horses and mules.	Neat cattle.	Sheep.	Swine.	Poultry of all kinds, estimated value.	GARDENS.		NURSERIES.		Value of the products of the dairy.	Value of the products of the orchard.
						Value of produce of market gardeners.	Value of produce of nurseries and florists.	No. of men employed.	Capital invested.		
					dollars.	dollars.	dollars.		dollars.	dollars.	dollars.

" " oats.....	123,071,341	Cords of wood sold		5,068,891

The foregoing returns are made by the officers of the United States who bear the name of marshals. The detailed accounts include not only the returns of each state, but those of each county in each state; and also of the smaller divisions of each county, called townships. The agricultural statistics of the United Kingdom might, in a similar manner, with very little trouble, and at not much expense, be made out at least once in ten years, and even for every five years, by taking that of each parish. I feel greatly indebted to the Hon. Daniel Webster, who sent me, most obligingly, a complete copy of all the voluminous returns made by the marshals of the United States.

ESTIMATE OF the Crops for 1843 and 1844 ; by Mr. Ellsworth.

CULTIVATION OF RICE.

"Landgrave Thomas Smith, who was governor of the province in 1693, had been at Madagascar before he settled in Carolina. There he observed that rice was planted and grew in low and moist ground. Having such ground at the western extremity of his garden, attached to his dwelling-house in East Bay-street, he was persuaded that rice would grow therein, if seed could be obtained. About this time a vessel from Madagascar, being in distress, came to anchor near Sullivan's Island. The master of the vessel inquired for Mr. Smith as an old acquaintance. An interview took place. In the course of conversation, Mr. Smith expressed a wish to obtain some seed-rice to plant in his garden, by way of experiment. The cook, being called, said he had a small bag of rice suitable for that purpose. This was presented to Mr. Smith, who sowed it in a low spot in his garden, which now forms a part of Longitude-lane. It grew luxuriantly. The little crop was distributed by Mr. Smith among his planting friends. From this small beginning, the first staple of South Carolina took its rise. It soon after became the chief support of the colony.'

"Its introduction contributed much to the prosperity of that part of North America. It became valuable, not only for consumption at home, but as an article for exportation. By an act of parliament, 3rd and 4th of Anne (1706), rice was placed among the enumerated commodities, and could only be shipped directly to Great Britain; but afterwards, in the year 1730, it was permitted to be carried, under certain limitations and restrictions, to the ports of Europe lying south of Cape Finisterre. Its culture had so increased, that, as early as 1724, 18,000 barrels of it were exported; and, from November, 1760, to September, 1761, no less than 100,000 barrels were shipped from South Carolina.

"In 1770, the value of this article exported, being in quantity about 160,000 barrels, amounted to 1,530,000 dollars.

EXPORTS from 1791 to 1843.

"*Wine.*—North Carolina, Pennsylvania, Virginia, Ohio, and Indiana, rank highest, in their order, in the production of wine. In Maryland, Georgia, Louisiana, Maine, and Kentucky, some thousands of gallons are likewise produced. Two acres in Pennsylvania, cultivated by some Germans, have the past autumn (1842) yielded 1500 gallons of the pure juice of the grape, and paid a net profit of more than 1000 dollars. Still, the quantity produced is small. The cultivation of both the native and foreign grape, as a fruit for the table, seems to be an object of increasing interest in particular sections of our country; but any very decided advances in this product are scarcely to be expected.

"Near Mississippi city, in Mississippi, grapes are said to succeed well. One person is mentioned who had, on an average, from vines four years old, over 200 fine bunches to the vine. Some others have had over 500 bunches to the vine. Mr. Mottier, of Delhi, near Cincinnati, has six acres wholly devoted to grape-vines. The vineyard was planted in 1829, and began to yield fair returns in two or three years; and, during the whole period, he has lost but a single crop. He finds there a northern preferable to a southern exposure. The Swiss vine-dressers, it is said, say that, in Switzerland and Germany, if they save the crops of three years out of five, they think they do well. 'About 1500 gallons of wine were made last year (1842), for which he finds a ready sale at one dollar per gallon. The Catawba affords a white wine in good repute with connoisseurs, resembling Rhenish. The Cape grape makes a red wine

more like Burgundy. His vines, this year (1843) are in a very promising state; and should nothing untoward occur, he thinks they will yield him from 200 to 400 gallons of wine to the acre.' There are also said to be some half-dozen other vineyards in the vicinity; and the amount of American wine manufactured there, and the preparations for extending the business by Germans from the valley of the Rhine, are stated to be larger than would be imagined. 'The Scuppernon grape of North Carolina has been pronounced by a French gentleman, not very ready to admit the excellence of American grapes, to be equal, if not superior, to any he had ever seen in France.' It is said that, 'in southern climates, under the best management, 2000 gallons an acre may be calculated on as a vineyard product. Some of the vines of ten or twelve years' growth yielded half a barrel a-piece.' A gentleman in North Carolina, who this last year made thirty barrels, intends the next year to make forty or more. The culture of the grape has also been successful in Louisiana, and the following calculations have been said to have been the result of experience: 'One acre planted with 1000 vines will produce a crop of fruit weighing 50,000 lbs., which will yield, after pressing and allowing for all waste, 16,666½ lbs. of pure juice, or 2083 gallons of wine.' Some clusters of the kind, called the grape of Canaan, are said to weigh from five to six pounds a bunch. The grape has also been cultivated very successfully as a fruit for the table, in the vicinity of New York. One gentleman at Croton Point is said to have twenty acres of the Catawba and Isabella grapes. The country abounds with many fine native grapes, some of which have already been adapted for cultivation. A southern journal speaks of the discovery, within the past year, of a white cluster or bunch grape, indigenous to the United States, in a remote unsettled part of Leake county, in Mississippi, on the Yokanodkano river. The bunches are very large; the fruit transparent, thin skinned, and oval; pulp soft, with three seeds inclosed; it is a great bearer, of delicious flavour, and was long known to the Indians. It is called the Yokanodkano grape.

"As a good mode of preserving grapes, it is recommended that they be put 'in tight boxes or kegs in alternate layers with carded bats of cotton.'

"The whole amount of the wine crop in the tabular estimate for the United States, is 139,240 gallons.

"*Madder*, which was mentioned in the report for 1842, is said to repay a net profit of 200 dollars to the acre when properly managed. It produced on the farm of a gentleman, who has devoted some attention to this product in Ohio, at the rate of 2000 lbs. per acre, and he believes it may be made to produce 3000 lbs., which is a greater crop than the average crops of Germany and Holland. It is probable that it may hereafter be more an object with our farmers, but the introduction of its culture among them must be gradual. Nine acres have been planted by one person in 1839, which he harvested in 1842. The labour required is said to be from eighty to 100 days' work per acre, and a crop is not reaped till it is three years old. The nature of the soil in which it is cultivated is said to have considerable influence on the colour of the dye produced from madder.

"*Olives*, it is asserted, may be grown in some of the southern states. A gentleman in Mississippi, is stated, in an agricultural journal, to have 'the olive growing, which, at five years from the cutting, bore fruit, and was as large at that age as they usually are in Europe at eight years old.' 'The olive here,' it is added, 'will yield a fair crop for oil at four years from the nursery, and in eight years a full crop, or as much as in Europe at from fifteen to twenty years of age.' The lands and climate there are stated to be as well adapted to the successful cultivation of the olive for oil, pickles, &c., as any part of Europe. Some hundreds of the trees are said also to have been growing in South Carolina, and the owner expressed his conviction that this product would succeed well on our sea-coast of Carolina and Georgia. The frosts, though severe, did not destroy or injure them; and in one case, when the plant was supposed to be dead, and corn was planted in its stead, its roots sent out shoots. It is well known to be a tree of great longevity—even reaching to 1000 or 2000 years; so that when once established, it will produce crops for a great while afterwards. The expense of extracting the oil is also stated to be but trifling.

"*Indigo*.—This was once a most important crop in South Carolina, and some attention has been given to it by an individual or two in Louisiana, and the enterprise is said to promise success; and enough might undoubtedly be raised in this country to supply our own market, so that we should not be dependent on other nations for this article. Some indigo produced at Baton Rouge is pronounced to have been equal to the best Caraccas, which sells at two dollars per pound; and the gentleman who cultivated it remarks, that one acre of ground there, well cultivated, will yield from forty to sixty pounds; that it requires only from July to October for cultivating it; that there is not connected with it one-third of the expense of time that is generally required for the cultivation of cotton. He, therefore, intends in future to turn his attention to the cultivation of indigo, in preference to cotton.

"*General Remarks*.—The root crops form a very important item as fodder, and are cultivated with increasing success in many parts of the country. The turnip has not yet become as great a favourite among our farmers as it is in England, where very large crops are produced; nor are carrots, the product of which has sometimes in England reached to over thirty-seven tons per

acre ; or parsnips, which are said to be excellent food for horses and cattle. Parsnips, also, stand the winter better than any other root vegetable. Swine, too, are fond of them. Besides the *ruta бага*, mangel wurtzel, sugar beet, and other varieties of the beet, occupy a useful place on the farm, and are more or less cultivated in this country.

"An account of an experiment respecting the raising of pumpkins on grass land, and the great amount produced from one vine, furnishes some important facts with reference to the culture of that product, showing that it might be rendered very profitable.

"The productions of the orchard—apples, peaches, and pears, and other varieties of fruit—are most successfully raised for market in some of the states. The peach orchards of New Jersey and Pennsylvania form a source of large profit to their enterprising proprietors. The apple crop suffered severely the past year in some of the New England states.

"Many farmers in Wisconsin territory are said to be beginning to give their attention to the production of wool ; large flocks have been introduced into the southern counties.

"Much is doing to ascertain the best breeds of cattle for our country, and many noble specimens have been exhibited the past year at the agricultural fairs in various parts of the union, showing the increasing attention which is given to this subject.

"The products of the dairy, too, and the apiary, with the new methods of raising poultry, might claim a notice. The subject of the best modes of cultivation, manures, and the proportions of the various parts of husbandry to one another, belong to the general subject."—*Mr. Ellsworth's Report.*

Prickly Comfrey.—Some experiments have been made in the New England states for feeding cattle ; and that on being gathered only once in two years, an acre produced 2400 bushels. It is regarded as indigenous to America.

Apples.—The following are extracts from letters to Mr. Ellsworth :

"For some years I have been experimenting upon the apple-tree, having an orchard of 20,000 bearing Newtown pippin trees. I have found it very unprofitable to wait for what is termed the bearing year, and, consequently, it has been my study to assist nature, so as to enable the tree to bear every year.

"I have noticed that it produces more profusely than any other tree, and, consequently, requires the intermediate year to recover itself, by extracting from the atmosphere and earth the requisites to enable it to produce.

"One year is too short a time for so elaborate a process, and, if unassisted by art, the intervening year must necessarily be lost. If, however, it is supplied with the necessary substances, it will bear every year—at least, such has been the result of the following experiments :

"Three years ago, in April, I scraped all the rough bark off several thousand trees in my orchard, and washed the trunk and limbs within reach with soft soap, trimmed out all the branches that crossed each other early in June, and painted the wounded part with white lead, to keep out moisture ; then split open the bark, by running a sharp-pointed knife from the ground to the first set of limbs in the latter part of the same month, which prevents the tree from becoming bark-bound, and gives the inner wood an opportunity of expanding.

"In July, I placed one peck of oyster-shell lime around each tree, and left it piled about the trunk until November, during which three months the drought was excessive. In November, the lime was dug in thoroughly. The following year (1842), I collected from those trees 1700 barrels of fruit, some of which were sold in New York for four dollars per barrel, and others, in London, for nine dollars ; the cider made from the refuse, delivered at the mill two days after its manufacture, I sold for three dollars seventy-five cents per barrel of thirty-two gallons, not including the barrel. *In making cider I never wet the straw.* After gathering the fruit in October, I manured the same trees with stable-manure, having secured to it the ammonia, and covered it immediately with earth.

"Strange as it may appear, this year (1843), the same trees literally bent to the ground with the finest fruit I ever saw. The other trees in my orchard, not treated as above, were barren.

"I am now placing around each tree one peck of charcoal-dust, and propose, in the spring, to cover it from the compost heap.

"I have grown corn, beets, and carrots, in pure charcoal-dust, likewise cuttings of the rose-bush, *camella japonica*, grape-vine, and wax-plant, and believe it to be one of the most valuable manures we have. Once placed upon the soil, it is there for ever.

Plums.—Fourteen years since, I removed eighty plum-trees from the lower part of my farm in the month of May, and set them in rich, sandy loam land, which is the best soil for them. They were valuable varieties, such as the blue gage, yellow egg, magnum bonum, &c., and had borne profusely four years before they were taken up. For the space of thirteen years after their removal they never bore a single plum, although they grew luxuriantly. In the fall of 1842, I placed half a bushel of shell lime round each tree, and fast March, half a bushel of pulverised charcoal. In May they were covered with blossoms, and bore a profusion of fruit.

"When large black excrescences appear on plum-trees, I cut off the limbs affected, and burn them. They are caused by a worm."

CALCULATION AND ESTIMATES OF PRODUCTION OF WHEAT AND OTHER BREAD STUFF GRAINS, AS BEARING UPON CONSUMPTION IN, AND EXPORTATIONS FROM, THE UNITED STATES.

THE following statements and tables are prepared from official accounts, and from a series of observations and tables which were drawn up and published in an extra number of the *Philadelphia Commercial List* for 1842.

The cause of that alarm, which has been so generally manifested by the landed interests of England, as to the United Kingdom, in the event of a free trade in corn and other food from America, has, it will appear, no foundation.

Mr. Gladstone has, with forcible truth and ability, in his recently published remarks, proved how utterly groundless have been the complaints against the liberal portions of the tariff of 1842. The following statements and tables will show that the export of corn and flour from the United States has not increased in proportion to the increase of population, and goes far to prove how little the landed interest of the United Kingdom has to fear from the competition of American agriculture. We could further prove that, in the advance of nations, the consumers of agricultural produce increase more rapidly in numbers than the producers. The reason is, that cities, manufactures, trades, navigation, &c., draw people from cultivating the soil, and from the rural districts. This is especially the case in America.

In the United States the population employed in agriculture has, it is true, increased rapidly, but not so rapidly as the population of the towns, and those employed in the fisheries, in ship-building, in the timber trade, in the fur trade, in the producing of naval stores, in navigating the ocean, rivers, lakes, and canals; and as those employed in manufactures, handicraft trades, and on railways and other public works.

We must also take into our calculation those employed in agriculture, who are not producers of wheat, other bread stuffs, and food, viz., those engaged in the cultivation of tobacco, of cotton wool, and, in Louisiana, of sugar.

The author of the interesting papers which were prepared for the Philadelphia paper, which we have quoted above, describing the wheat crops observes:—

“It is very generally believed abroad, that this valuable grain is of very general culture in our country, but such is not the fact. This table divides the states and territories into three districts:—The first embraces the six New England states; the second, the states in what may be called the ‘Wheat District,’ extending from latitude 35 deg. to 45 deg. north, and from longitude 5 deg. east to 15 deg. west of Washington; and the third, states south of latitude 35 deg. The cultivation of wheat was commenced in the New England states at quite an early date after their first settlement, and with sufficient success to supply the wants of the colonists, but it could not be continued with profit when Pennsylvania was settled, and its lands, more congenial to wheat, subjected to the plough. Then, the hardy and adventurous sons of the Puritans, found it their interest to ‘cultivate’ the ocean, and, by exchange of its productions purchase flour and grain from the descendants of Penn. The efforts made since the revolution, and, by aid of bounties, even down to within three or four years, to revive the cultivation of wheat in the eastern section, have proved alike unsuccessful; and the agricultural pursuits of New England will, doubtless, in future be confined to the more suitable

products of Indian corn and potatoes, with pasturage of cattle and increased growth of wool in parts more remote from the sea board.

"With the states south of the wheat section, we have included North Carolina, for although a great part of this state lies north of 35 deg., and wheat is cultivated towards its northern parts, the soil in general is better adapted to Indian corn, and the quantity cultivated is large. It may also be remarked of New Jersey, that, although within the wheat latitude, it cannot be called a wheat growing state, as in all that part towards the ocean on which the state borders for near 150 miles, the soil is too light and sandy for this grain; and Indian corn and rye are its leading products. In reference to the culture of wheat in both these sections—the eastern and the southern—Washington, in his letter to Arthur Young, dated December 5, 1791, gives the following opinion:—'But the country beyond these (New York and New Jersey) to the eastward (and the farther you advance that way it is still more so), is unfriendly to wheat, which is subject to blight and mildew, and, of late years, to a fly, which has almost discouraged the growth of it. The lands, however, in the New England states are strong, and productive of other crops. To the southward of Virginia, the climate is not well adapted to wheat, and less so as you penetrate the warmer latitudes.' Experience has fully confirmed the correctness of his judgment, and, it is now admitted that in neither of those districts can wheat be raised to profit even in competition with the more remote parts of the great wheat district, since the cost of transportation from those has been reduced by artificial communications.

"To the north of 45 deg. north on this continent, the length and severity of the winters will prevent the cultivation of wheat to any material extent. This opinion will appear remarkable in England, when it is considered that the most southerly point of Great Britain is near north latitude 49 deg., and that the culture of wheat is successfully extended to north latitude 55 deg. But that island has an open ocean to the north and west, and the North Sea to the east; whereas the American continent, towards the north-west, is unbroken to the Polar Sea, and to the north, and towards north-east, is indented with immense bays, covered by ice for nine months in the year.

"To the west of longitude 15 deg. west of Washington, commence those extensive prairies extending to the Rocky Mountains, on which it is not likely the cultivation of wheat will be extended nor any permanent settlement made, except along some of the water-courses, for years to come. The want of wood and water on those plains will stop the advance of the civilisation in that direction, and leave them to the Buffalo and the Indian. How far it will be practicable to cover them with sheep, horses, and cattle, controlled by man, as on the steppes of the Banda Oriental, remains to be ascertained by experiment.

"The wheat section within 10 deg. of latitude and 20 deg. of longitude, embraces about one-half the surface of the states, or one-fourth of that of the states and territories, but within this there is abundance of untouched land of the finest quality awaiting the invasion of the cultivator. Nor can that be delayed; for the wants of a population constantly increasing both within and without this district, and not regarding foreign countries, demands a rapid increase in the growth of wheat. If our estimate is correct, that the United States and territories will number 22,000,000 inhabitants in 1850, the additional quantity to be raised in that year over 1840, to supply an increase of 5,000,000 consumers at home, and leave seed, &c., must be about 22,000,000 bushels, equal to the whole crop raised in 1800. To bring the cultivation up to this point it becomes necessary that for ten years 130,000 acres of new land per annum should be put under wheat culture alone, and three times that quantity under culture in corn, rye, oats, or in pasturage. To accomplish this will require that the labour of full one-third of the whole increase in population be directed to agricultural pursuits in this district.

"On reference to Table No. 8, it will be observed that we have stated the consumption of wheat at the average of three bushels and a half per head in the eastern district (New England states), four bushels and one-twelfth per head in the wheat district, and two bushels per head in the southern, or cotton and sugar district. These very low estimates will appear remarkable in England, where the consumption of wheat is estimated at six to eight bushels per head. It is, easy, however, to account for this difference, which arises from the more general consumption in this country of Indian corn, rye, and buckwheat, for culinary purposes. In the eastern states, Indian corn and rye are generally used, and, in parts more remote from the sea-coast, wheat bread is almost unknown. In the middle and western states, with the agricultural population in particular, more than half the bread is made of corn and rye meal; and buckwheat is also extensively used. In the southern and south-western states, corn becomes the leading article, and, in some, rice is an important auxiliary; but, to the coloured population (full one-half in those states) wheat is unknown. This will account for the very low estimate of two bushels per head, which we have given for the consumption of wheat in the southern district. Throughout every part of the United States, Indian corn is raised. It is used both green and ripe; is easily prepared for food, and fully as nutritious as wheat. Its usual cost per bushel, in the interior, is about one-third that of wheat, and, for human nutriment, one bushel of Indian corn is perhaps equal to one bushel and three-fourths of barley, or three bushels of oats. It is not, therefore, surprising, that the use of this invaluable grain should be so general, and that of oats and barley unknown—but for animal food and the brewery.

"Although it must be apparent from the views now given of the present state of the growth and consumption of wheat in the United States, that there is no inducement to seek new markets for that grain, we are still interested in any measures that will be likely to give more regularity to the demand for old markets, and greater steadiness to our prices. The measures now in agitation affecting these points are, an alteration of the corn laws of Great Britain, and a new adjustment of our tariff.

"In the former country, the corn law question is so completely mixed up with politics, and surrounded by prejudice, that a clear and disinterested judgment as to what is best for the whole population, will scarcely be attained. It is understood, that the new ministry will not present any law allowing a free trade in corn, or establishing a fixed duty, but will adhere to the '*Sliding Scale*,' making some alteration in its graduation.

"By late returns it appears that the population of Great Britain, in 1841, was	18,664,761	
"	"	1831 "
"	"	16,366,011
	Increase.....	2,298,750
"Ireland, in 1841	8,203,382	
" " 1831	7,784,536	
	Increase.....	410,846
		410,846

Aggregate increase of the British Islands in ten years..... 2,609,596

"Without reference to this increase in Ireland, it is evident that to supply that of Great Britain with wheat at the lowest estimated consumption of six bushels per head, requires that the growth in 1841 should exceed that of 1831—13,800,000 bushels; and for seed, starch, &c., we may add 2,200,000 bushels, making 2,000,000 quarters. At the estimated product per acre of three quarters, the increased breadth of land required for wheat alone, would be 660,000 acres, and for barley, oats, potatoes, pasturage, &c., 1,980,000 acres more, say 2,640,000 acres, to supply the wants of 2,298,750 inhabitants. Has this quantity of new land been found on the surface of the island and put under cultivation? or have its industrious farmers, by bringing for manure guano from the Pacific, and bones from the continent, been able to increase the product of the old lands, to meet this demand? In relation to the first inquiry, it is much doubted if any extent of unenclosed first or second quality lands could have been found, and under present circumstances the operation of the corn laws must be to force into wheat culture third quality lands, that can yield no profit even at high prices, and only increase the uncertainty of dependence on home growth for bread. The spirited and intelligent agricultural societies have made great exertions to extend the growth of wheat on the old lands by improved methods of culture, and to a certain extent with success; but still, that increase is not sufficient to meet all the new demands for consumption, and give surplus stocks adequate for the contingencies of their very uncertain climate. A succession of favourable seasons may afford relief for a time, but this cannot be permanent, and some radical change in the system becomes daily more necessary.

"If we look forward ten years, and suppose the population to increase in that time 2,500,000, and that 3,000,000 acres more land must be brought under culture, we would again ask, where is it to be found? The prime minister of England had better give up the search, and by a liberal alteration of the corn laws, endeavour to make bread more uniformly cheap, by allowing wheat to be imported free of duty from those countries that take goods in exchange.

"If the parliament of Great Britain will not make a change in the corn laws sufficiently liberal to give an abundant supply of bread at moderate prices to operatives at home, let it immediately appropriate an adequate sum to carry them to this country. We want no paupers, but sober and industrious men with healthy families will be received *free of duty*, and in our western country they will find food cheap and employment abundant. The *grain* trade must, in short, take this course, the consumer must seek food in other countries, if it is not allowed to reach him at home.

"Had the corn laws been absolutely repealed in 1825, the establishment of manufactories in the United States might have been procrastinated for many years; but no change in those laws can now materially change the course of production in this country, and any alteration made will not be considered as a boon to agricultural nations, but as a measure forced on the government by the wants of a population increasing more rapidly than agricultural productions on a limited extent of land and in an uncertain climate. Great Britain must relinquish the idea of being able to keep provisions *high* at home, and supply all the world with *cheap* goods. This cannot be done without starving the operative.

"The first efforts of the colonists were directed simply to supply their own wants, and those of a continued accession of emigrants from various parts of Europe. *It was well known to them that England, then a grain exporting country, would not receive wheat in exchange for such articles of clothing as they required: and hence came the establishment in the colonies of some coarse manufactures of a domestic kind.* But the hardy sons of New England began to look towards the

ocean for products of exchangeable value, and on the borders of the Chesapeake, labour was directed to tobacco; but the followers of Penn persevered in the cultivation of wheat. This continued to be very much the state of production down to the commencement of the war of 1755. By this time the settlements had extended as far south as Georgia; the population of the colonies had greatly increased, and, in the middle states, cultivation had made considerable progress in land, especially along the waters of the principal rivers. In Pennsylvania, a population of 250,000 had extended to the South Mountain, embracing the counties of Chester, Lancaster, Berks, Northampton, Bucks, and Philadelphia; but even previous to this time, *the rising importance of the trade of the colonies had excited the jealousy and cupidity of the mother country, and laws were enacted to confine their trade to her markets, and to prevent the growth of manufactures with them, even to the making of a horse-shoe.*

"But, at the conclusion of the war of 1755, the condition of the colonies had undergone a material change. Their exports and imports had greatly increased, and so continued up to the commencement of the revolutionary struggle. In the interim, England had, in a great measure, ceased to export wheat, and her West India possessions became more dependent on her North American colonies for supplies. Pennsylvania profited by this demand, and, in exchange for large quantities of flour, bread, &c., exported from Philadelphia, she received the products of the Antilles. As early as the year 1765, her exports were:—Bread, 34,736 barrels; flour, 148,887 barrels; wheat, 367,522 bushels; corn, 60,206 bushels. And, in 1773, bread, 48,183 barrels; flour, 265,967 barrels; wheat, 182,891 bushels; corn, 179,217 bushels. Showing an export of wheat, or wheat products, in 1773, from our city, to places now foreign, greater than in any year subsequent to the revolution. At that time, the exports of bread stuffs from Baltimore and New York were altogether unimportant. South of the Susquehanna, few merchant mills existed. The first of any importance in the vicinity of Baltimore were erected by the Ellicotts and Tysons, who removed from Pennsylvania about the year 1765, and whose energy and enterprise gave that impulse to the millering business there, which, of the little town of Baltimore, on an inlet of the bay, without interior water communications, but with water power convenient for manufacturing purposes, has made a great city.

"The quantity of wheat returned, as the product of the very superior crop of 1839, in New York, was:—

	bushels.
Taken for seed and starch, ten per cent, or.....	1,185,350
For human food—population returned, 2,428,921, at four bushels	
and a quarter per head.....	10,927,164
	11,512,514

Surplus left..... 840,993

about equal to the 'tailings' of such a crop commonly used for animal food. Now the crop of 1839, in New York, no doubt exceeded the average of the three crops preceding, fifteen per cent, and that of 1841 full thirty per cent. This result will appear extraordinary to those who have not fully considered the subject; but it may be reconciled by a view of the flour trade of New York. Suppose we debit that state with all the flour and wheat brought into it from the Lake Country, from New Orleans, and all the Atlantic states, south of it; and then give it credit for all the flour and wheat exported to foreign or domestic ports, continuing the account for five years, so as to have a fair average, what would be the balance in favour of New York production?

"The population of Pennsylvania has not increased so rapidly as that of New York, and although her surplus of wheat is not, perhaps, so great as twenty or even thirty years back, it is still very considerable, but as little good land now remains unbroken in Eastern Pennsylvania, and labour is fast seeking mining and manufacturing employments, this surplus will gradually diminish, and the time is not very remote when our metropolis will have to rely on the country beyond the Ohio, for wheat bread. In all the old wheat districts in the states of Delaware, Maryland, and Virginia, the land is so completely exhausted by continued cropping, that it must be abandoned for years until restored to vigour by the re-operative powers of nature, or transferred to another population, better qualified to recover it by art and industry. In the upper section of those states, and towards the western parts of Maryland and Virginia, a different agricultural system prevails, and there the cultivation of wheat is still on the advance.

"If we make a natural line of the Mississippi to the confluence of the Ohio, and up this river to Pittsburg, and thence draw an imaginary line north to Lake Erie, and continue it round the northern and eastern frontiers of the United States, it will be found, that at this time, the wheat raised in all this section of the United States is about equal to what is consumed in it, and that the whole surplus shipped from the United States to foreign countries including Canada, is in fact produced in the states and territories north and west of the Ohio river. We have stated the whole export in 1840, to September 30th, at 11,208,365 bushels, and the wheat and flour of the crop of 1839, which left those states, &c., for Canada, or came to the Atlantic cities by various outlets,

the Ohio and Mississippi rivers, the canals and railroads of Maryland, Pennsylvania, and New York, was about equal to this quantity. The estimate may, however, be made in another way. In the states and territories beyond the Ohio river, the wheat raised in 1839, 26,000,000 bushels, and allowing 12,000,000 bushels for consumption at four bushels per head, and 2,500,000 bushels for seed, starch, &c., we have left a surplus for export from that section of 11,500,000 bushels. Now, it is a striking fact, that this surplus, in short the whole disposable surplus of the United States, is furnished by that section of our country the most remote from our Atlantic seaports, and with the aid of all the natural or artificial communications existing, it cannot reach those ports, from the places of shipment, much less from the farmer's door, at a charge per bushel and forty-five or fifty cents freight, insurance, commission, and wastage included. From Cleaveland to New York, the charge is about thirty-seven and a half cents; from Pittsburg to Philadelphia about forty cents, and these are the nearest and most convenient shipping points. What then does the farmer in those states get for his wheat when the price in our Atlantic cities is one dollar per bushel? Is it not a matter of serious consideration whether, with our rapidly increasing population, the consumption of wheat has not already approached too close to its production? not leaving a sufficient margin to meet the contingency of a bad crop, which might make it necessary again to import from Europe; and under circumstances not so favourable to obtain supplies as those which existed in 1837 and 1838. It is evident from the experience of the last fifty years, that the increase in the cultivation of wheat, merely extends in proportion to the wants of the home population, not giving any increase in the surplus for export, unless in years of over production, or when the home consumption is lessened by high prices arising from unusual demands for other countries. If permitted to carry this table forward to the year 1850 by analogy, the important items would then stand, perhaps, nearly as follows:—

Population of the United States	22,000,000
" of the Atlantic cities	1,200,000
" of the seven interior cities.....	400,000
Land under wheat culture.....	acres, 6,000,000
Product of average crop at twenty bushels.....	120,000,000
Required for seed, starch, &c.....	bushels, 12,000,000
For export to foreign places	" 12,000,000
For home use	" 96,000,000

"In this estimate we are induced to advance the average product per acre to twenty bushels, as the great increase in wheat cultivation for the next ten and many succeeding years, must be on the rich virgin soils to the north and west of the Ohio river.

"On examination of No. 4, the first important fact apparent, is the great increase of the export of flour to the British North American colonies in the year ending September 30, 1840. This has arisen from the circumstance that wheat of colonial growth is admitted into England either free, or at a duty not exceeding five shillings per quarter, imperial measure, at any time, and the large quantity shipped from Canada to England has been replaced by imports from the Lake states. This import has been greatly facilitated by the opening of the Welland canal, at the same time, the abundant crop of 1839, has afforded a surplus adequate to this demand. Its continuance will depend very much on the future product of harvests in England, or on changes which may be made in British corn laws.

"In exports to the West Indies, there has also been a material increase of wheat flour and corn meal, and this arises principally from a demand for those English islands in which emancipation has been carried out. From our former great market in Cuba, we are nearly altogether excluded by heavy duties on flour, intended to encourage importations from Spain. The markets of South America continue to take about the usual average quantity, and that no increase of late years has taken place in these demands on us for the markets of Brazil, notwithstanding the great increase in our importations of coffee from that country, may be attributed to the fact, that considerable shipments of flour have been made from Europe to the Brazils of late years.

"To Great Britain our exports of flour present an aspect of irregularity in demand, arising from the uncertainty of crops there, as well as the peculiar working of her corn laws. These of late have been so managed as to admit at low duties large quantities of wheat from the continent of Europe, paid for by export of gold—but to discourage the American shippers, even at moderate prices, and when no specie would have been required in payment. How long this state of things will be permitted to continue, will depend much upon the present ministry in England—but to us the interest constantly lessens in any European market for bread stuffs, as our rapidly increasing population affords a more certain market at home.

"The comparison made in Tables Nos. 5 and 6, does not show any average increase in our exports of flour for five years, ending September 30, 1840—for though the export in 1840 was the greatest ever made from this country, the failure of our crop in 1836, and deficiency in that of 1837, occasioned the exports of 1837 and 1838 to fall full fifty per cent below an average. But it will probably appear that for the next ten years, steady American markets will be found for 1,250,000 barrels, annual average export, if the increased growth of wheat should be such as to meet the wants of a population continually on the advance; and leave such a surplus for export.

I.—POPULATION, compared with the Growth, Consumption, and Export of Wheat, in Three Sections of the United States.

On referring to the Inspection Tables it will be observed, that the great increase in the supply of flour brought to market, is to ports east of the Potomac, as no material change is apparent in the average inspections of the ports of Virginia for some years; and in the district of Columbia, what Georgetown has gained by the opening of the Ohio canal to the Shenandoah valley, Alexandria has lost.

VI.—STATEMENT of the Exports of Flour and Wheat from the United States, from the Year 1790 to 1843, and also of the Average Price of Wheat in England, and of Flour in Philadelphia, and the Population of the United States during the same period.

YEARS.	Bushels of Wheat exported.	Average price of Wheat in England, per Quarter.	Barrels of Flour exported.	Average price of Flour at Philadelphia, per barrel.	Value of Flour exported at average prices, in Philadelphia.	Quantity of Flour shipped to England.	Exports of Flour from Canada.	Population of the United States.

* In 1837, when the previous harvest in the United States yielded under an average crop, the imports of wheat amounted to much more than double the quantity ever exported in any one year; viz., to 3,921,259 bushels, imported from various countries. In 1838 there were imported 896,560 bushels of wheat, and 12,731 bushels of flour.

† The population returns for the present year, 1845, may be placed at about 20,000,000.

PROVISIONS AND LIVE STOCK EXPORTED.

The rearing of horned cattle and of swine, for provisions, for tallow, for lard, and for their skins, has not been neglected in the United States. But, unless it may be the pork and lard of the north-western states, the quantity salted or prepared for foreign markets, has scarcely increased. This will appear from the following table.

QUANTITY and Value, the Produce of Animals, Exported from the United States, in each Year, from 1791 to 1844.

YEARS.	Quantity of Beef.	Quantity of Pork.	Value of Beef, Tallow, Hides, and Live Cattle.	Value of Butter and Cheese.	Value of Pork, Bacon, Lard, and Live Hogs.	Value of Horses and Mules.	Value of Sheep.	Aggregate Value.

1844.....								

The increase of exports during the year ending the 30th of September, 1842, and during the nine months ending the 30th of June, 1843, has been attributed in this country to the British tariff, which came into operation in the latter end

of 1842. In order to show the fallacy of such an assertion, it must be remarked that the exports of 1842 were effected before the British tariff came into operation ; that the duty on butter, cheese, and tallow, were not reduced in that tariff; that no live cattle, hogs, sheep, horses, or mules, were exported at all to the United Kingdom ; and that the exportation of beef, pork, hams, bacon, lard, tallow, butter, hides, &c., were chiefly to the following countries, viz., in 1842, and for the nine months ending the 30th of June, 1843.

The imports into the United Kingdom of the above articles, the produce of the United States, have been of comparatively unimportant value ; of those on which duties have been reduced in the tariff of 1842, none are of any consequence in the amount imported except lard, and France has taken more than double the quantity of lard from America that has been imported from the United States.

Lard and lard oil will hereafter continue to be one of the principal animal products which America will export. Not for food, but for burning in lamps, and for the use of machinery and of manufactures.

PORK TRADE OF CINCINNATI.

"Twenty years since (says a recent writer on this business), we are told, it was so insignificant, that no one house was engaged in it exclusively, and the whole number of hogs then cut in one season did not exceed 10,000. At that period the hogs were killed (as isolated farmers now kill them in the country) out of doors, and then hung upon a pole. The butchers charged the farmers twelve and a half to twenty cents, per head, for killing them, and the offal as at present. From this insignificant beginning the business has increased, so that the number of hogs killed this year (1842) will probably reach 250,000, and the butchers now frequently pay ten to twenty cents premium per head for the privilege of killing them. And instead of a few houses incidentally engaged in the business a part of the year, there are now twenty-six pork houses exclusively engaged in it, and which

use a capital of *nearly 2,000,000 of dollars, which, by the way, has been mostly foreign this season, owing to the disasters of the last three years.*

"The district of country in the west devoted to the raising of pork as an article of commerce, includes Ohio, Kentucky, Indiana, Illinois, Missouri, Iowa, and a part of Tennessee; but the bulk of the business is done within a circle of 300 miles in diameter, with Cincinnati as its centre, including the contiguous parts of Ohio, Kentucky, and Indiana. Hogs, are, however, frequently driven to this market from a distance of 200 miles, as notwithstanding large numbers are killed at various places in the Wabash and Miami valleys, at Madison, Indiana, Portsmouth, Chillicothe, &c., this business will concentrate in the largest cities, where labour, salt-barrels, and other facilities are naturally most abundant. In a populous city, also, the steaks, spare-ribs, &c., not used in packing, can always be disposed of for cash, without loss; and in this city, also, if anywhere in the west, active cash capital is always found.

"In the above district the number of hogs prepared for market this season will not fall short of 500,000 (and this is not a larger number than usual), besides the vast amount detained for domestic consumption. Of this number 250,000 are probably packed in Cincinnati, 150,000 more will probably come here for a market or reshipment, and 100,000 more may be set down as the estimate for those that will be shipped from various other towns on the river, without being landed here. Of the above number 75,000 are raised in the Wabash valley alone.

"Our hogs are fed on Indian corn exclusively. They are never '*fed on mutton*,' as an English nobleman lately stated at an agricultural fair. The stock is well crossed with imported animals from Europe, of the various Chinese, Irish, English, and Russian breeds, and is probably exceeded by none in the United States. Hogs have been raised here, weighing over 1200 lbs., but the average runs from 200 to 250 lbs.—the latter size being the most desirable.

"In Kentucky, the drovers frequently buy the hogs alive of the farmers by gross weight, as is sometimes the case in Ohio and Indiana. But generally the farmers club together (each one having his hogs marked), and drive them to market themselves in droves of 500 to 1000, and seldom less than 500, except in the immediate vicinity of the city. During the first day or two the hogs cannot well travel more than four to six miles; but after that they travel eight and sometimes ten miles per day, depending upon the condition of the roads. The Yorkshire are said to be the best travellers.

"Having reached some of the extensive slaughtering establishments in the neighbourhood of the city, a bargain is made with the butchers to kill and dress them, which is done for the offal, and the hogs, after being dressed, are carried to town at the expense of the butcher.

"The hog is bought by the pork packer, completely dressed by the butcher, and delivered at the pork-house."

Notwithstanding the above account, it does not appear that the export of pork or beef to foreign countries has, or will, increase (see tabular statements). The increased consumption of animal food by the large towns, by those engaged in the inland and coasting, and foreign navigation, in the lake, river, shore bank, and whale fisheries, will keep pace with the probable increase of cattle and hogs raised for beef and pork.

Lard, Lard Oil, and Vegetable Oils.—Mr. Ellsworth in his reports for 1842 and 1843, states :—

"The subject of the manufacture of oil from corn and lard was introduced to the notice of the public in the report of last year. As corn oil has heretofore been connected with distillation, although it is easily made, and answers a good purpose, less attention has been devoted to it. It has been suggested, on good authority, that it can be gathered from the mash which is prepared for fermentation for feeding swine. If this should be confirmed by further experiments, as it would not be liable to the same objection urged against the former,

the manufacture of spirituous liquors, it may hereafter be carried on to a great extent. No doubt seems to be entertained of its value for burning, and all other purposes to which oil is applied but paintings.

"Much interest has been felt on the subject of oil from lard, and the almost daily inquiries respecting its process of manufacture, &c., and its close connexion with the question of disposing of our agricultural products, forms a reason for giving it a more extended consideration in these remarks. Complete success has attended the enterprise. Several large factories for the manufacture of this oil have been some time in operation in Cincinnati, and thousands of gallons are daily prepared for home consumption and exportation. It is also carried on at Cleveland, Ohio; Chicago, Illinois; Burlington, Iowa; Hannibal, Missouri; and other places both in the western and Atlantic states.

"It is considered much superior to olive or sperm oil for machinery and for the manufacture of woollens, &c. It can be furnished also at half the price, and therefore it will doubtless supersede that article of import. As it contains less gelatine than other oils, it is found much better for combing wool, for which purpose a single factory wished to contract for 10,000 gallons from one establishment. An order for 600 gallons, with this view has already been received for the use of a cloth factory in Huddersfield, England. Repeated experiments, too, have shown, that for the purpose of combustion no oil is superior.

"The following are given as the relative constituents of lard oil and sperm oil, in 100 parts of either :—

	carbon.	hydrogen.	oxygen.
Lard oil . . .	79.03	11.422	9.548
Sperm oil . . .	79.05	11.6	8.9

"It will be thus seen that the difference in carbon is only 3.00; about the same in hydrogen; while in oxygen it is about 4.10 in favour of the lard oil. The large quantity of carbon proves that it may be relied on as a material for giving light, as it is well ascertained that whenever carbon predominates in an animal oil the article is capable of a high degree of luminous power. Experiments have been made by Mr. Campbell Morfit, of Philadelphia. These resulted in favour of lard oil. About sixty lbs. in 100 lbs. of good lard, in tallow only twenty-eight lbs. is oil; and the processes of manufacture resorted to, show that it may be made a profitable business."—*Report for 1842.*

"The amount of lard and tallow worked into oil, and stearine candles, in the vicinity of Cleveland the past year, is 250 tons; while the year before it was only eighty tons. The process adopted with respect to sperm oil, in producing *stearine*, has not been found to answer with regard to lard and oil, on account of the different mode of their crystallisation. Compression answers in the former case; but in the latter it has a tendency to confine the fluid parts that may be separated. The usual modes, by the use of alcohol, camphor, acids, and alkalies, are found too expensive; but, by the improved method described by Mr. Stafford, a more beautiful article, clear, and capable of enduring a temperature of twenty degrees, is said to be produced. The oil which he mentions, is superior in appearance to the sperm oil of the stores.

"The candles of stearine sell, it is said, at from fifteen to twenty cents per pound, by the box; and, in light, are equal to the first quality of tallow candles, but last twice as long, and are not greasy in warm weather.

"Mr. Stafford states the price of lard at four and a half cents per pound, and says, that from May to August, he worked the average of 3500 pounds per day. The fattened hog can be turned into the steam tub (hams, blood, entrails, &c., excepted), separated by heat—the fat from the lean, bone, and muscle—and twelve hours after the fat is cold, and candles can be produced. The lighthouse and beacon at Cleveland have been exclusively supplied with lard oil, since the opening of navigation, for the past year. Mr. Stafford further says, that 'assuming pork to be worth one dollar fifty cents per cwt., by his improved process he could deliver, for lighthouses, the first quality of lard-oil in New York, at thirty-seven and a half cents per gallon, and candles, as described, at twelve and a half cents per pound, and leave a good broad margin for profit.' Mr. Wing gives a statement respecting this subject in Cincinnati. By his account there are four establishments for the purpose of manufacturing lard by steam in that city. It is said to succeed admirably, making it perfectly white and

pure; the process, too, proves a great saving of expense, as well as furnishes a larger quantity from the same amount of pork.

"For the conversion of lard into oil and stearine, there are, in Cincinnati, not less than thirteen factories in full operation, making from 300 to 2500 barrels each in a season, or 100,000 gallons. The oil sells there at sixty cents per gallon, by the barrel, and seventy-five cents by retail. The stearine made by one establishment amounts to 750,000 pounds per annum, two-thirds of which (the summer) is suitable for making candles. This stearine sells at seven cents per pound; and the winter, which is used for culinary purposes, is equal to the best leaf lard, and sells for six cents per pound, when well put up in kegs for shipping.

"Lard oil is also manufactured in Columbus, Ohio; Wheeling, Virginia; Pittsburg, Pennsylvania; Indianapolis, Indiana; St. Louis, Mobile; Springfield, Illinois; Nashville, Tennessee; New Orleans, Louisiana; Rochester, New York; New York city, and various other places."—*Report for 1843.*

It is stated in several papers that the demand for lard oil, as a perfect substitute for sperm oil will soon raise the price of hogs and pork.

CULTIVATION OF SUGAR IN THE UNITED STATES.

"The sugar-cane has, for several years, been extensively cultivated in Louisiana, and, for some time, to a limited degree in Georgia, and West Florida. In Louisiana, five kinds of the cane have been raised. The first is the Creole cane, which is supposed to have come originally from Africa. The second is the Bourbon cane from Otaheite. Besides these, are the riband cane, green and red; the riband cane, green and yellow; and the violet cane of Brazil. The latter species was abandoned soon after its introduction, as it proved less productive in our climate than any of the others. The other species are the best suited to the nature of the soil. They are all more or less affected by the variations of the atmosphere, are very sensible to cold, and are killed in part by the frost every year. Experience has demonstrated that the cane may be cultivated in a latitude much colder than was generally supposed; for fine crops are now made in Louisiana, in places where, a few years ago, the cane froze before it was ripe enough to make sugar.

"In the process of cultivation, the ground is ploughed as deep as possible, and harrowed; after it has been thus broken up, parallel drills or furrows are ploughed at the distance of two feet and a half to four feet from one another; in these the cane is laid lengthwise, and covered about an inch with a hoe. Small canals, to drain off the water, are commonly dug, more or less distant from each other, and these are crossed by smaller drains, so as to form squares like a chess-board. These ditches are necessary to drain off the water from rains, as well as that which filters from the rivers, which would otherwise remain upon the plantations. The average quantity of sugar that may be produced upon an acre of land of the proper quality, well cultivated, is from 800 to 1000 lbs., provided that the cane has not been damaged, either by storms of wind, inundations, or frost. The strong soil is easiest of cultivation, and most productive, in rainy seasons. The light soils require less labour, and yield more revenue, in dry seasons. To these variations, others are to be added, resulting from the different exposure of the lands, the greater or less facility of draining, and also from the greater or less quantity of a weed known by the name of coco or grass nut. Sixty working hands are necessary to cultivate 240 acres of cane, planted in well-prepared land, and to do all the work necessary until the sugar is made and delivered."—*Book of the United States.*

In an article in *Hansard's Register*, it is stated—

"That the great staple of Southern and Eastern Florida must be *Sugar*. We now call the attention of the planters of Georgia, the Carolinas, Alabama, and of Middle and West Florida, to the sugar hammocks and sugar savannahs of Florida, lying *East* of the Suwannee. And first, we observe, that East Florida embraces an area more than equal in extent to the state of South Carolina. It has been estimated by competent judges familiar with the country, that there are in East Florida, at the least calculation, 500,000 acres of the choicest sugar lands. The hammocks and savannahs that constitute *these sugar lands proper*, belt the eastern and southern coast of East Florida, and are permeated by navigable streams. They commence fifteen miles south of St. Augustine, and are divided thus:—

four-fifths are hammock, and one-fifth savannah land. The characteristics of the hammock soil are, a deep vegetable black mould, underlaid by a firm clay pan or stratum, based upon a bed of rich pure marl, of a dark clay colour, and this bed of marl varying from eight to twenty feet in depth, of course inexhaustible for soil or for manure. These hammocks are thickly studded with a luxuriant growth of, first, the cabbage-palm tree; second, live-oak, with gum, magnolia, orange, hickory, maple, ash, cedar, &c. The savannahs are even more valuable, having a similar but still richer soil, and without any timber to obstruct the process of immediate cultivation.

"The chief outlets of this sugar region (soil, and climate, and other advantages considered, the best, it is believed, on the continent of America), are the St. John's, the Ocklawaha, the Suwannee, the Santa Fé, Echactucnee New River, the Matanzas, Halifax, Hillsborough, and Withlacoochee; the harbour of St. Augustine, the Matanzas, Mosquito, and Indian River inlets. The value of these *sugar lands* is greatly enhanced from the fact that they are, in almost every instance, contiguous to, or surrounded by, the best provision and grazing lands, to an illimitable extent."

In the account given of the trade of New Orleans, we have given tabular statements of the exports of the cane-grown sugar of Louisiana. The following statements are from Mr. Ellsworth's Reports, for 1841, 1842, and 1843; and from various sources of information:—

"The progress of the sugar manufacture, and the gain upon our imports, has been rapid. In 1839, the import of sugars was 195,231,273 lbs., at an expense of at least 10,000,000 dollars; in 1840, about 120,000,000 lbs., at an expense of more than 6,000,000 dollars. A portion of this was undoubtedly exported, but most of it remained for home consumption. More than 30,000,000 lbs. of sugar, also, from the maple and the beet-root, were produced in 1841, in the northern, middle, and western states; and, should the production of corn-stalk sugar succeed, as it now promises to do, this article must contribute greatly to lessen the amount of imported sugars. Indeed, such has been the manufacture of the sugar from the cane for the last five years, that were it to advance in the same ratio for the five to come, it would be unnecessary to import any more sugar for our home consumption. Some further remarks on this particular topic will be found in connexion with the subject of corn-stalk sugar."—*Report for 1841.*

"The early frosts and high winds threatened it, and were thought to have cut off the crop by thousands of hogsheads; the clear, cold weather, however, succeeding, prevented it from proving so injurious as a milder and more moist season would have done. Even the frozen cane turned out very well, and thus nearly realised the full amount of the planters' expectations. The capital employed in the production of sugar, in 1842, is said to be 52,000,000 dollars, and the average manufacture is, probably more than 80,000,000 lbs., and 4,000,000 gallons of molasses."—*Report for 1842.*

"The crop of cane sugar for 1843 fell off. *Maple* sugar, also, proved a failure. Good molasses and syrup have been made from corn-stalk juice; and, though it has been found difficult to make a crystallised sugar from it, it appears evident that every farmer may supply, from his own ground, abundance of molasses or syrup."—*Report for 1843.*

POUNDS of Sugar produced in each State in 1840.—(Official Account.)

1842.....	1,942,575	4½ mills per lb.	6,370,775	"

"The whole produce of sugar in Louisiana, in the year 1828, was stated at 88,678 hogsheads of 1000 lbs. each; the capital invested in sugar estates estimated at 45,000,000 dollars; the number of sugar plantations in 1827 about 700; in 1840 only about 525

would seem to have been in operation. The average annual amount of sugar produced is about 90,000,000 lbs. The quantity of molasses produced in the same state is 4,000,000 gallons. The amount of capital then employed was 52,000,000 dollars, with 40,000 hands and 10,000 horses.

"According to the circular of Messrs. A. Gordon, Wylie, and Co., of New Orleans, issued at the close of 1844, the whole quantity of sugar produced that year in the United States is estimated at 126,400,310 lbs., of which Louisiana yielded 97,173,590 lbs. There are in this state 668 sugar plantations, of which 361 work by steam power, and the number of blacks employed amount to about 26,000. The yield varies according to the accidents of weather: in 1843, the crop was 140,316 hogsheads; in 1844, about 100,000; and the prospects of the coming crop are so favourable, that it will probably amount to 175,000 hogsheads. The lands cultivated are almost exclusively low alluvial land, bordering on the Mississippi, and the minor streams lying to the south and west. One or two estates have as many as 500 slaves, but the average of all is about forty hands, men and women. The product varies very much, according to circumstances and cultivation. On small farms as much as 10,000 lbs. of sugar per working hand has been made, but half that quantity would be a high average. The labourers are very well fed and clothed, and work moderately; and the slave population employed in the cultivation of sugar increases on all the plantations where the people have become acclimated. The cane cultivated is the species or variety called the riband cane, originally from Java, which has superseded the Creole or St. Domingo cane, as well as the variety brought from Tahiti.

"In a memorial addressed to the State Legislature, in 1840, it was stated that sugar could not be produced for less than five cents per pound; but field-hands, provisions, and lands are all cheaper since then, and at four cents it must be a remunerating crop. The extension of cultivation will much depend upon the protection afforded by the tariff. With the present duty of two and one-half cents per lb. on foreign sugar, large tracts of land in the union will be taken in; and there are still enormous tracts in Louisiana, well situated on water-courses now lying idle. Many experiments are making in the manufacturing of sugar, and these, with improved cultivation and draining, must long before augment considerably the quantity produced. But (observe Messrs. Gordon and Co.) we see no reason to suppose that the sugar of Louisiana can become an article of importance in European markets, save so far as it supplies, or fails to supply, the wants of the United States. It may be that with a very large crop, or a failure in the crops of the West India Islands, some small portion may find its way to Great Britain; but if so, it will be accidental, and not a supply to be looked for."

Mr. S. Tillotson, a sugar planter, New River, Louisiana, says: "The plants we cut and matlay in beds during the autumn, usually in October, previous to the sugar-making season, and before the canes are injured by frosts. Often the unripe tops, which would otherwise be thrown away, are winnowed for plants. The best plant cane we usually save for plants, because they are the easiest put up and the quickest planted; for time and saving of labour are money. Besides, by planting the whole stalk, it grows more vigorously than the tops, especially in a dry season.

"After the sugar-making season is over, which is usually about the 1st of January, we prepare our land designed for cane by ploughing and harrowing, breaking it from four to eight inches deep: the stiffer the land, the deeper the ploughing is necessary, to protect it from drought. Thus prepared, the ground is laid off in rows, with a two-horse plough, about six feet apart (some plant as close as four feet). In these furrows, a double-mould board plough with one horse is run, in order to clear the furrows of lumps and sods, and also to deepen and widen the furrows, as it is necessary to put the plants several inches below the surface, otherwise the cane would require too much hilling, especially the second and third years.

"The plants are now taken off from these mats, and the leaves stripped off, placed in carts, carried and tipped out on the prepared land, and laid lengthwise in the furrows. We plant three canes side by side, or triple; some say one and a half is sufficient. The closer the rows, the less each would require. We now pass along with a cane-knife, and cut the cane in pieces, say from two to three feet in length, in order that the canes may lie more level, and because more eyes will vegetate. Being thus placed, they are covered

with a plough to the depth required, from one to three inches; over which a light harrow may be passed. Many prefer to cover with the hoe. As soon as the freshets are over in February, the cane is ploughed—running the bar each side the cane, and throwing the furrows from it; the cane, beginning to come up, is scraped (so called); if covered too deep, the earth is taken off, usually with a hoe, sometimes with a harrow or other machine, and cleaned from grass and weeds. In a few weeks it is again ploughed and hoed, and again, when necessary; a little earth put to it when required.

“The cane by April or May has come up thick in the rows, but usually not so thick but that the stalks, when about a foot and a half or two feet high, send out many new stools or shoots from the bottom of the stalk; and, if they come out early, grow and mature equal to the main stalk. It is usual to give it three or four workings, and, in the last, to hill the cane three or four inches, and sufficiently high to protect the lower eyes on the stalks from freezing during the winter. Those eyes vegetate next spring, and produce nearly equal to the first season, on fresh land, and so again the third year, and often longer. Cane is injured by hilling before the stools are sufficiently high, and should receive the last working soon after it is about three feet high, in order to afford more time for ripening. After this period, say in June, it grows very rapidly; the joints begin to appear, and the lower ones begin to ripen and sweeten; and, by the middle of October, usually ripen from two to four feet from the bottom, and continue to ripen about a joint or six inches a week, till they are cut for the mill, or till the freeze comes, or till they are cut to winrow, in order to secure them from an anticipated freeze. About the middle of October, we commence making sugar. Each hand takes a row; first cuts the top of the stalks off, just below the green leaves, and drops them on the ground, or lays them in winrow, if designed for plants; then, with the knife (the blade of which is about eighteen inches in length and two inches in breadth), the dry leaves are stripped from the stalks, and the cane is cut close to the ground; the left hand, at the same time, has hold of the canes thus cut, and places them in small heaps, convenient for loading into carts, drawn by horses, mules, or oxen. Other hands load the cane, and it is hauled to the mill.

“The cane-fields are all ditched, usually every acre in width, with cross ditches about every five acres. No water is allowed to remain on the surface. The cultivation is as simple as that of broom corn, and the young shoot far more vigorous.

“Cane-stalks usually grow from six to nine feet high. The leaves shoot up two or three feet higher. Cane ripens in favourable seasons within twelve or eighteen inches of the top. You will perceive we plant one-third of our cane-land, or crop, yearly; two-thirds coming from the ratoons.

“The crops have not been good in Louisiana for several years past. That of 1841 was injured by the early frosts, and the amount was not so great as that of 1839 by nearly one-third. The crop of 1842 was an average one; that of 1843 was also rather limited, compared with previous seasons. In the year ending September 1839, the river craft brought to New Orleans 70,000 hogsheads of sugar, and 25,000 hogsheads of molasses.—(See exports from New Orleans.)

“We planted, the 8th of April, 1843, four acres in corn, in drills; half of which were three feet, and half four feet apart; and when thinned out, the stalks stood about three inches apart in the rows.

“The corn was well cultivated, and in fine condition; ploughed three times, hoed twice, and harrowed once, and grew large.

“The embryo ears were taken off three times, and before the kernels were formed.

“It was cut, rolled, and boiled, on the 28th of July, after the tassels were dead, and the fodder beginning to dry. It was topped about five feet high, and a very little above, when the embryo ears were taken. The bottom of the stalk appeared more juicy and ripe than the top. The four acres produced sixty cart (body) loads, and yielded 1800 gallons of juice, weighing eight degrees by the syrup-weigher, which, when boiled to the granulating point (139 degrees Beaumé's thermometer, or forty-four degrees by the saccharometer), produced 200 gallons of syrup, and showed no appearance of granulation after standing two months in the coolers; the cause of which was probably owing, in part, to the unripeness of the corn-stalk when cut; but, provided it had granulated as well as usual

for the cane syrup, it would have produced 1300 lbs. of sugar, and eighty-two gallons of molasses."

Cost of Cultivating and Manufacturing Four Acres of Corn—Man and Team.

The following statements are added to Mr. Ellsworth's report, showing the results of collecting corn-stalks and canes for making sugar, on the banks of New River, Louisiana, in 1843, by Messrs. Tillotson.

"According to our test, the corn-stalk juice required very little lime, and that principally to get the temper. The most simple mode of ascertaining the striking point (or when the syrup is boiled sufficiently), and one of the most perfect is, by dipping into it a small skimmer (milk skimmer), and blowing through it; and when the bubbles rise on the opposite side, in diameter, say, three-fourths of an inch, and before they blow off, the boiling is completed.

"Objections may be made to many of our calculations, but the result will be nearly the same. We admit that an extraordinary yield of corn-stalk may produce double this amount; the same may be said of sugar-cane—2000 lbs. per acre is a common yield for good plant cane; and seldom has a season passed without our making it.

"We have just commenced making sugar this season, and rolled none but ratoon cane (which usually produces much less than plant cane), and it produces exceeding 1000 lbs. per acre; and this has been an unfavourable season for cane. The juice of the corn, as before stated, weighed eight degrees. The juice of the cane we are rolling weighs eight degrees also; and, by lowering the knives (topping lower), it would weigh nine degrees and one-half, and later in the season it will be still sweeter.

"We think it an error to suppose the sugar-cane will not mature in this country. Cane, like the corn-stalk, begins to ripen from the bottom. True, the seasons are too short to mature entirely to the top, though they often do mature six or seven feet high. We are now cutting from two to four feet.

"It seems to us, making sugar or molasses from corn-stalks is impracticable, except far in the interior, or far from water or railroad communication.

"It appears to be overlooked by some writers on the subject, that sugar-cane, in this country, is only planted once in three, four, or five years—usually every three years; that three, four, or five crops, are taken from one planting.

"We have often made exceeding a hogshead, or 1000 lbs., from an acre, the fifth season after planting; thus making, from one planting, six to eight hogsheads of sugar. The longer the ratoons are cultivated, the drier (the less juicy) the cane becomes.

"We doubt not many of our sugar-planters may doubt the correctness of this statement; nevertheless, it is true, and we trust none who know us will question the statement. It is customary to burn off, early in the spring, the trash or leaves from the cane-fields. We seldom burn any, but rake them into the centre, between the rows, and bar the cane, turning the furrows on them, where they soon form manure to nourish more vigorously the plant, and the better to protect the ratoons for the succeeding crops.

"In expressing the juice, some use steam mills. We use horses and mules, believing them cheaper, as they are all needed to work the crop. We work twenty-four horses to one mill, making three changes; eight horses carry the mill, and are capable of taking off a crop of 400 hogsheads of sugar.

"Our mill, cylinders, housing, and wheels, are cast-iron, with wrought-iron journals, and composition or brass boxes; cylinders three feet and a half in length, and two feet in diameter, and work horizontally, cost about 2000 dollars. The cost of a mill suitable for expressing twenty-five gallons of juice per hour from corn-stalks, worked by one horse, would probably not exceed 300 dollars, if all made of iron; wooden housing, on which the cylinders and boxes set, would answer well, and the expense would be much less."

EXTRACT of a Letter from Mr. Webb to Mr. Ellsworth on Corn-stalk Sugar, dated
Wilmington, December 30, 1843.

"I have never received the letter of which you speak, on the subject of maple sugar; but I have received one from you on the subject of corn and cane sugar, written by S. and R. Tillotson, which is herewith returned, as requested. In relation to the communication of these gentlemen, I would remark, that they estimate the profit of cane culture much higher than my former information had led me to consider it. The net annual revenue of many Louisiana planters must (according to their estimate) equal, if not exceed, the salary received by the President of the United States. But, as I have no practical acquaintance with the subject, I will not presume to doubt the correctness of their calculations. Their experiment with corn appears to have been well conducted, and I have no fault to find with any part, except the inferences which they draw from it. It does not follow, because *they* have failed, that others may not succeed; or, that they themselves may not in future arrive at a more favourable result. It may be that a more northern latitude is better suited to the crop. I have never known the juice to weigh so light as eight degrees. Here, it has uniformly ranged from nine degrees to ten degrees. The fact, that their syrup failed entirely to granulate, shows that there must have been something wrong either in the crop or in its manufacture; and, of course, no certain inference can be drawn from the result of their experiment. But, admitting that no objections of this kind could be urged, has it not been just as completely proved, by careful experiment, that steamboats could never succeed? Has it not been theoretically demonstrated, on scientific principles, that railroads could never be used as a means of rapid communication? Such cases have been too numerous, and are too well known, to require any more than a mere allusion to them. It may be considered as settled, that the manufacture of corn sugar, in the large way, cannot be profitably carried on by the process which succeeds with cane. There is a foreign substance in the syrup, which this process fails to remove, and which prevents its speedy granulation. This is a great objection to the manufacture on a large scale; and, though it cannot be considered an insurmountable one, it must be admitted that it has not yet been obviated.

"The family manufacture, by farmers, can, however, be safely recommended as entirely practicable, for the syrup may be used to the same advantage in a liquid as in a solid state.

If, in manufacturing, evaporation is hastened by the use of flat-bottomed pans, with such other arrangements as will ensure its speedy accomplishment, and the syrup, after being boiled sufficiently, is kept at a temperature not under seventy degrees, it will never fail to granulate. It has been found, from experience, that pans made of Russia sheet iron, six inches deep, are well suited for evaporation. It must not be forgotten, when corn is cultivated for sugar, that it is not the only valuable product which may be secured.

"The leaves and tops from an acre of corn (planted closely), are equal in value to an acre of good grass.

"The Messrs. Tillotson found the expense of growing and manufacturing one acre of corn for sugar, to amount to fifteen dollars. If we admit that the produce of an acre in hay is worth an equal sum, then it follows that, whatever sugar or molasses may be made, is so much clear gain."

Maple Sugar.—The maple forest districts of the northern, middle, and north-western states, are the localities where the sugar from the sugar maple (*acer saccharinum*) is made.

The sugar maple (*acer saccharinum*) differs from the great maple, in its fibres being generally straight and coarser, its wood not being so hard or compact, and its sap granulating more perfectly. From its juice, principally, is made the maple sugar; although all the varieties of maple that we know of, if we class them agreeably to the saccharine matter contained in their saps, might be called sugar maples.

The process of obtaining sugar from the sap of the maple is simple. In the early part of March, at which time sharp frosty nights are usually followed by bright sunshining days, the sap begins to run.

A small notch, or incision, making an angle across the grain, is cut in the tree, out of which the juice oozes, and is conveyed, by a thin slip of wood, let in at the lower end of the cut, to a wooden trough, or dish, made of bark, placed below, on the ground.

The quantity of sap thus obtained from each tree varies from one pint to two gallons per day. Those who follow the business fix on a spot where maple-trees are most numerous, and erect a temporary camp, or lodging. When they have as many trees tapped as can be attended to, the sap is collected once or twice a day, and carried to a large pot, or boiler, hung over a wood fire near the camp. It is then reduced by boiling until it granulates; and the sugar thus obtained is rich, and pleasant to the taste. An agreeable syrup is also made of maple sap. The maple ground occupied by a party is termed a "Sugarie;" and those who first commence tapping the trees consider that possession for one year constitutes right for those years that follow. They often receive, without having any tenure themselves of these lands from the crown, a consideration from others for the right of possession. Great improvements have been made in crystallizing and purifying maple sugar in the United States.*

* "To the Committee on Maple Sugar of the New York State Agricultural Society.—Gentlemen: I herewith submit to your inspection fifty lbs. of my maple sugar. The following is a statement of the manner of making and clarifying the same.

"In the first place, I make my buckets, tubs, and kettles all perfectly clean. I boil the sap

TOBACCO CULTURE.

The growth and enormous consumption of a plant, prepared not as a product of use and nourishment, but as a stimulant—and which was unknown in Europe three centuries ago—is remarkable, as exhibiting how far human labour, skill, and wealth have been, and continue to be, expended on an article which is altogether unnecessary. The introduction of the *distillery* in Europe was a remarkable event; but, as far as the distillation of spirits as a drink, certainly in no way useful, though assuredly pernicious both to health and morals. The growth and use of opium and betel in the East are as remarkable, and at least as injurious, as the distillation and drinking of spirits, and far more injurious than the use of tobacco.

When nations refuse to pay ordinary taxes, it is astonishing how cheerfully they consent to pay high taxes on such articles as tobacco, opium, and spirits. Of the enormous taxation levied annually in the United Kingdom (at least 50,000,000*l.*) stimulating drinks, and other stimulants, are taxed to the amount of 18,250,000*l.*; viz.: distilled spirits, 7,250,000*l.*; wine, 2,000,000*l.*; malt and hops, 5,250,000*l.*; tobacco, 3,750,000*l.* Now, there is no compulsion to pay any part of these duties; for the law can be legally avoided by refraining from the use of them, and for using which there is not, as far as the health and the strength of the people are concerned, the least benefit derived, while extensive voluntary evil is inflicted on the majority of those who indulge in these stimulants.

The progress of the use of tobacco is shown by the following statement, compiled for *The Northern Light*, Albany, New York, 1841.

“The whole world, within the space of about three centuries, have become chewers, smokers, and snuffers. The Chinese chews and smokes his opium, the East Indian his betel, and the European and American their tobacco. Against these practices it is useless to declaim. It was in vain that the parliament of England discouraged the *flagrant delit* of smoking; in vain did James I. assure his subjects that the custom was ‘loathsome to the eye, hateful to the nose, harmful to the brain, dangerous to the lungs, and in the black

in a potash kettle, set in an arch in such a manner that the edge of the kettle is defended all around from the fire. I boil through the day, taking care not to have any thing in the kettle that will give colour to the sap, and to keep it well skimmed. At night, I leave fire enough under the kettle to boil the sap nearly or quite to syrup by the next morning. I then take it out of the kettle, and strain it through a flannel cloth into a tub, if it is sweet enough; if not, I put it in a cauldron kettle, which I have hung on a pole in such a manner that I can swing it on and off the fire at pleasure, and boil it till it is sweet enough, and then strain it into the tub, and let it stand till the next morning. I then take it and the syrup in the kettle, and put it all together into the cauldron, and sugar it off. I use to clarify, say 100 lbs. of sugar, the whites of five or six eggs, well beaten, about one quart of new milk, and a spoonful of sal-eratus, all well mixed with the syrup, before it is scalding hot. I then make a moderate fire directly under the cauldron, until the scum is all raised; then skim it off clean, taking care not to let it boil so as to rise in the kettle before I have done skimming it. I then sugar it off, leaving it so damp that it will drain a little. I let it remain in the kettle until it is well granulated. I then put it into boxes made smallest at the bottom, the will hold from fifty to seventy lbs., having a thin piece of board fitted in two or three inches above the bottom, which is bored full of small holes, to let the molasses drain through, which I keep drawn off by a tap through the bottom. I put on the top of the sugar, in the box, a clean damp cloth; and over that a board, well fitted in, so as to exclude the air from the sugar. After it has done, or nearly done, draining, I dissolve it, and sugar it off again; going through with the same process, in clarifying and draining, as before.

“JOEL WOODWORTH.”

stinking fume thereof, nearest resembling the horrible Stygian smoke of the pit that is bottomless.' The strong arm of the law opposed it; the priest and the physician, the moralist and the philanthropist arrayed themselves against it; all to no purpose. Opposition only served to make proselytes, and the custom has spread far and wide under persecution, till over the whole surface of the globe its fumes arise constantly to the atmosphere, and it is at this moment, perhaps, the most general luxury in existence. In the city of New York alone, the consumption of cigars is computed at 10,000 dollars a day—a sum greater than that which its inhabitants pay for their daily bread; and in the whole country the annual consumption of tobacco is estimated at 100,000,000 lbs., being seven pounds to every man, woman, and child, at an annual cost to the consumer, of 20,000,000 dollars!

"It may be curious to mark by what gradations the use of tobacco has reached this grand crisis. The subject attracted the attention of Professor Beckmann of Gottingen, about the middle of the last century, who took great pains to ascertain the dates of its introduction into the different countries of Europe, and from whose work some of the following items are gathered. He conjectures, that even before the discovery of the fourth quarter of the globe, a sort of tobacco was smoked in Asia; and this opinion was also entertained by the celebrated traveller M. Pallas, who says that, 'Among the Chinese, and among the Mogol tribes, who had the most intercourse with them, the custom of smoking is so general, so frequent, and become so indispensable a luxury; the tobacco purse affixed to their belt so necessary an article of dress; the form of the pipes, from which the Dutch seem to have taken the model of theirs as original; and, lastly, the preparation of the yellow leaves, which are merely rubbed to pieces and then put into the pipe, so peculiar, that we cannot possibly derive all this by the way of Europe from America, especially as India, where the habit of smoking tobacco is not so general, intervenes between Persia and China.' It may be too late now to investigate the subject, even if it should be considered worth the trouble. But there is one more important confirmation of Professor Beckmann's conjecture to be adduced from Ulloa's 'Voyage to America,' who says, 'it is not probable that the Europeans learned the use of tobacco from America; for, as it is very ancient in the eastern countries, it is natural to suppose that the knowledge of it came to Europe from those regions by means of the intercourse carried on with them by the commercial states on the Mediterranean Sea. Nowhere, not even in those parts of America where the tobacco grows wild, is the use of it, and that only for smoking, either general or very frequent.' We have nothing, however, authentic, earlier than the following:—

"In 1496, Romanus Paine, a Spanish monk, whom Columbus, on his second departure from America had left in that country, published the first account of tobacco, with which he became acquainted in St Domingo. He gave it the name of *cohoba*, *cohabba*, *gioia*.

"In 1519, tobacco is said to have been discovered by the Spaniards near Tobasco, though it is assigned to the next year.*

"In 1535, the negroes had already habituated themselves to the use of it, and cultivated it on the plantations of their masters. Europeans likewise already smoked it. We also find, from a passage in 'Cartier's Voyage,' that it was used in Canada.†

"In 1559, tobacco was introduced into Europe from St. Domingo, by a Spanish gentleman named Hernandez de Toledo, who brought a small quantity into Spain and Portugal. In the same year Jean Nicot, envoy from the court of France to Portugal, first transmitted thence to Paris, to Queen Catharine de Medicis, seeds of the tobacco plant; and from this circumstance it acquired the name of *Nicotiana*. When tobacco began to be used in France, it was called *herbe du grand prieure*, from the grand prieure of the house of Lorraine, who was then very fond of it. It was also called *herbe de St. Croix*, after cardinal Prosper St.

* "Cette plante (tabac), acre et caustique, trouvee en 1520, pres de Tobasco dans le golfe du Mexique."—*Precis sur l'Amerique*, p. 116.

† "There groweth a certain kind of herbe, whereof in summer they make great provision for all the yeere, and only the men use of it; and first they cause it to be dried in the sunne, then weare it about their neckes, wrapped in a little beastes skinne made like a little bagge, with a hollow peece of stone or wood like a pipe; then when they please they make poudre of it, and then put in one of the ends of the said cornet or pipe, and laying a coal of fire upon it, at the other end sucke so long, that they fill their bodies full of smoke, till that it cometh out of their mouth and nostrils, even as out of the tonnell of a chimney."

Croix, who, on his return from Portugal, where he had been nuncio from the pope, introduced the custom of using tobacco. It was received at once in France and the Papal States with great enthusiasm, in the form of powder or snuff; it was some time after this period, that smoking became popular.

"In 1565, Conrad Gesner became acquainted with tobacco. At that time several botanists cultivated it in their gardens. The same year Sir John Hawkins carried tobacco from Florida to England, where 'all men wondered what it meant.'

"In 1570, they smoked in Holland out of conical tubes composed of palm leaves plaited together.

"In 1575, first appeared a figure of the plant in Andre Thevot's 'Cosmographie.'

"In 1585, the English first saw pipes made of clay among the natives of Virginia, which had just been discovered by Sir Richard Grenville. It appears, likewise, that the English soon after fabricated the first clay tobacco pipes in Europe.

"In 1590, Schah Abbas of Persia, prohibited the use of tobacco in his empire; but the practice had become so deep-rooted among his subjects, that many of them fled to the mountains, and abandoned every thing else to enjoy the luxury of smoking.

"In the beginning of the seventeenth century they began to cultivate tobacco in the East Indies.

"In 1604, James I. of England endeavoured, by means of heavy imposts, to abolish the use of tobacco, which he held to be a noxious weed.

"In 1610 the smoking of tobacco was known at Constantinople. To render the custom ridiculous, a Turk, who had been found smoking, was conducted about the streets with a pipe transfixing through his nose. For a long time after, the Turks purchased tobacco from the English, and that the refuse. It was late before they began to cultivate the plant themselves.

"In 1615, tobacco began to be sown about Amersfort, in Holland, which afterwards became famous for its cultivation.

"In 1616, the colonists began to cultivate tobacco in Virginia. It is not known whether the plant was indigenous, or whether it came from a more southern country. It is supposed the seeds were from Tobago. But it seems to have been in use among the Virginia Indians at the time they were visited by the English, and was called by them *petun*, or *petum*. Clavigero says, 'tobacco is a name taken from the *Haitine* language.' Humboldt also derives it from the same language, and says that the term was used to designate the pipe, or instrument made use of by the natives in smoking the herb, which the Spaniards transferred to the herb itself, and after them the other nations of the old world.

"In 1619, James I. wrote his 'Counterblast to Tobacco,' and ordered that no planter in Virginia should cultivate more than 100 lbs. a year. He also prohibited its sale in England or Ireland until the custom should be paid and the royal seal affixed; 20,000 lbs. were exported this year from Virginia to England, the whole crop of the preceding year.

"In 1620, ninety young women were sent over from England to America and sold to the planters for tobacco, at 120 lbs. each. The price at first was 100 lbs., which gradually increased to 150 lbs. King James issued a proclamation restraining the disorderly trade in this obnoxious article. In the same year some English companies introduced the smoking of tobacco into Zittau, in Germany, and Robert Konigsman, a merchant, brought the tobacco plant from England to Strasburg.

"In 1622, the annual import of tobacco into England from America, for the last seven years was 142,085 lbs.

"In 1624, the pope published a decree of excommunication against all who should take snuff in the church, because then already some Spanish ecclesiastics used it during the celebration of mass. King James restricted the culture of tobacco to Virginia and the Somerset isles, and forbade its importation from any other quarter, considering England and Wales 'as utterly unfyt, in respect of the clymate, to cherish the same for any medicinall use, which is the only good to be approved in yt.'

"In 1631, smoking of tobacco was introduced into Misnia by some Swedish troops.

"In 1634, a tribunal, called the chamber of tobacco, was formed at Moscow, which prohibited smoking under pain of having the nose slit; and the Grand Duke defended the

entrance of tobacco with the infliction of the knout for the first offence, and death for the second.

"In 1639, the grand assembly of Virginia passed a law, that all tobacco planted in that and the two succeeding years, should be destroyed, except such a proportion to each planter as should make in the whole 120,000 lbs., and that the creditors of the planters should receive forty pounds for every 100 lbs. due them.

"In 1653, smoking began in the canton of Apenzell, in Switzerland. At first the children ran after those who smoked in the streets. They were likewise cited before the council and punished, and the innkeepers were ordered to inform against such as should smoke in their houses.

"In 1661, the police regulation of Berne, in Switzerland, was made, which was divided according to the ten commandments. In it, the prohibition to smoke tobacco, stands under the rubric, 'thou shalt not commit adultery,' and was continued in force until the middle of the last century.

"In 1669, the crimes of adultery and fornication were punished in Virginia by a fine of from 500 to 1000 lbs. of tobacco.

"In 1670, and the two following years, smoking of tobacco was punished in the canton of Glaurus, by a fine of one crown Swiss money.

"In 1676, the whole custom on tobacco from Virginia, collected in England, was 600,000 dollars. In the same year, two Jews first attempted the cultivation of tobacco in the margravate of Brandenburg; but which, however, was not brought to bear till 1681.

"In 1689, Jacob Francis Vicarius, an Austrian physician, invented the tubes for tobacco pipes, which have capsules containing bits of sponge; however, about the year 1670, already pipes were used having glass globules appended to them, to collect the oily moisture exuding from the tobacco.

"In 1690, Pope Innocent XII. excommunicated all who should be guilty of taking snuff or tobacco in the church of St. Peter at Rome.

"In 1697, great quantities of tobacco already were produced in the palatinate of Hesse.

"In 1709, the yearly exports of tobacco from America for the last ten years, were 28,858,666 lbs.; of which 11,260,659 lbs. were annually consumed in Great Britain, and 17,598,007 lbs. countries of Europe.

"In 1719, the senate of Strasburg prohibited the culture of tobacco from an apprehension that it would diminish the growing of corn.

"In 1724, Pope Benedict XIV. revoked the bull of excommunication published by Innocent, because he had acquired the habit of taking snuff.

"In 1732, tobacco was made a legal tender in Maryland, at one penny a pound.

"In 1747, and the two years previous, there were annually exported to England from the American colonies, 40,000,000 lbs. of tobacco, 7,000,000 lbs. of which was consumed in England. The annual revenue was about 4,500,000 dollars.

"In 1753, the King of Portugal farmed out the tobacco trade for about 2,500,000 dollars. The revenue of the King of Spain from tobacco, amounted to 6,330,000 dollars.

"In 1759 the duties on tobacco in Denmark brought in 40,000 dollars.

"In 1770, the Empress of Austria received a revenue from tobacco of 800,000 dollars.

"In 1773 the duties on tobacco in the Two Sicilies, amounted to 446,000 dollars.

"In 1775, the annual export of tobacco from the United States, for the last four years, was 1,000,000 lbs.; for the last thirty years it averaged 40,000,000 lbs., of which 7,000,000 lbs. were consumed in Great Britain, and 33,000,000 lbs. in the other European countries.

"In 1780, the King of France received from tobacco a revenue of about 7,250,000 dollars.

"In 1782, the annual export of tobacco during the preceding seven years' war of the Revolution, had been 12,378,504 lbs. Of the total seven years' exportation, 33,974,949 lbs. were captured by the British.

"In 1787, the quantity imported into Ireland, was 1,877,579; in 1829, 4,124,742 lbs.

"In 1789, the quantity exported from the United States, together with the two previous years, averaged about 90,000,000 lbs.

"In 1820, the quantity of tobacco grown in France had doubled in three years, being 32,887,500 lbs.

"In 1828, the revenue on tobacco in the state of Maryland was 27,275 dollars.

"In 1830, the revenue on tobacco and snuff in Great Britain was nearly 13,000,000 dollars.

"In 1834, the value of tobacco used in the United States was estimated at 16,000,000 dollars; of which 9,000,000 dollars were supposed to have been for smoking Spanish cigars; 6,500,000 dollars for smoking American tobacco and chewing; and 500,000 dollars for snuff.

"In 1838, the annual consumption of tobacco in the United States was estimated at 100,000,000 lbs. valued at 20,000,000 dollars cost to the consumers, being seven pounds to each individual of the whole population.

"In 1840, it was ascertained by a committee appointed to procure and report statistical information on the subject, that about 1,500,000 persons were engaged in the manufacture and cultivation of tobacco in the United States; 1,000,000 of whom were in the states of Virginia, Maryland, Kentucky, and Missouri. Allowing the population of the whole country to be 17,000,000, it will be seen that nearly *one-tenth* are in some way engaged in the cultivation or manufacture of this article. The value of the export during that year was nearly 10,000,000 dollars."

CULTIVATION OF TOBACCO IN THE UNITED STATES.

"There are four kinds of tobacco reared in Virginia, namely, the *sweet-scented*, which is the best; the *big and little*, which follow next; then the *Frederick*; and lastly, the *one and all*, the largest of all, and producing most in point of quantity. The Virginian tobacco is reckoned superior to any raised in the southern states; and great care is taken by the regulations of the state, that no frauds be practised upon the merchants, and that no inferior tobacco be palmed upon the purchaser. For this purpose, houses of inspection are established in every district where tobacco is cultivated, whose regulations are rigorously enforced; this contributes, as much as the real superiority of the article itself, to keep up its price in the market. Every person who intends his tobacco for exportation, packs it up in hogsheads, and thus sends it to one of the inspecting houses. Here the tobacco is taken from the cask, which is opened for the purpose; it is examined in every direction, and in every part, in order to ascertain its quality and its purity; if any defect is perceived, it is rejected and declared to be unfit for exportation. If no defect appear, it is pronounced to be exportable. It is then repacked in the hogshead, which is branded with a hot iron, marking the place of inspection, and the quality of the contents; and then lodged in the inspecting storehouses, there to await the disposal of the planter, who receives a certificate of the particulars, serving at the same time as an acknowledgment of the deposit. It is by selling this *tobacco note* to the merchant that the planter sells his tobacco. The purchaser, on viewing this note, is as well acquainted with the article, as if he had inspected it himself; and he has only to send the note and transfer to the store where the tobacco lies, and it is immediately delivered out, agreeably to his orders. This measure has insured a preference in the foreign market to the Virginian tobacco, and prevents the deterioration of the article."—*Book of the United States*.

It is a curious fact, that notwithstanding the variety of climate and soil in the United States, every state and territory in the union produces tobacco. In many of the states its cultivation is, of course, a secondary object, and perhaps in some, it is attended to as a matter of curiosity. But in most of the states, probably, a sufficient quantity has been grown to show that, with attention to this object, it might, in case of necessity, be resorted to as a profitable crop. In Maine and New Hampshire, the amount returned in 1840 is small, being only thirty pounds in the former, and 115 lbs. in the latter. In Massachusetts, it appears to have more attention, 64,955 lbs. being returned, and in Vermont, 585 lbs. In Connecticut, 471,657 lbs. were raised, and in Rhode Island, 317 lbs., making in the New England states together 537,659 lbs. In the middle states, also, some attention has been paid to the cultivation of it. In New York, 744 lbs. are returned, and in New Jersey, 1922 lbs.; Pennsylvania, 325,018 lbs., and Delaware, 272 lbs.; making the product of the middle states, 327,956 lbs. But the states in which the great bulk of the crops is grown,

lie between the latitudes of about 34 deg. and 40 deg. We have arranged the following table according to the quantity produced in each state :—

	lbs.		lbs.
1 Virginia	75,347,106	Brought forward	218,902,243
2 Kentucky.....	53,436,909	17 Florida	75,274
3 Tennessee	29,550,432	18 Massachusetts.....	61,955
4 Maryland.....	24,816,012	19 District of Columbia.....	55,550
5 North Carolina	16,772,359	20 South Carolina	51,519
6 Missouri	9,067,913	21 Iowa	8,076
7 Ohio	5,942,275	22 New Jersey.....	1,922
8 Indiana.....	1,820,306	23 Michigan	1,602
9 Illinois	564,326	24 New York	744
10 Connecticut.....	471,657	25 Vermont	585
11 Pennsylvania	325,018	26 Rhode Island	317
12 Alabama	273,302	27 Delaware	272
13 Georgia.....	162,894	28 New Hampshire	115
14 Arkansas	148,430	29 Wisconsin	115
15 Louisiana	119,824	30 Maine	30
16 Mississippi	83,471		
Carried forward.....	218,902,243	Total	219,163,319

From which table it will be seen that Connecticut and Pennsylvania hold the tenth and eleventh rank as producers.—The following shows the quantity raised in non-slave-holding states.

	lbs.		lbs.
Ohio.....	5,942,275	Brought forward	9,200,881
Indiana	1,820,306	Vermont.....	585
Illinois	564,326	Rhode Island	317
Connecticut	471,657	Delaware	272
Pennsylvania	325,018	New Hampshire	115
Massachusetts	64,955	Wisconsin	115
Iowa.....	8,076	Maine	30
New Jersey	1,922		
Michigan	1,602	In non slave-holding states..	9,202,315
New York	744	Slave-holding states	209,961,004
Carried forward	9,200,881	Total crop	219,163,319

The whole crop of 1840, therefore, if the returns be correct, is 219,163,319 lbs., which, at the estimate of 1200 lbs. to the hogshead, would be equal to 182,636 hogsheads, which, at the average price of that year, eighty-one dollars five cents per hogshead, would make the value of the crop of the United States that year 14,802,647 dollars 80 cents. The average annual export for the ten years, ending with 1840, was 96,775 hogsheads, which, if that year be an average crop, would leave a surplus for consumption and future exportation of 85,861 hogsheads. The actual exportation in 1840, ending September 30, per treasury returns, was 119,484 hogsheads. The principal exports are formed of the produce of Virginia, Kentucky, Tennessee, Maryland, and North Carolina, the crops of which states, according to the census returns, make as follows :—

	hogsheads.		hogsheads.
Virginia	62,789	Brought forward	152,627
Kentucky	44,531	North Carolina	13,968
Tennessee	24,625	The other slave-holding states..	8,375
Maryland	20,682	Non slave-holding states	7,668
Carried forward.....	152,627	Total crop	182,638

MANUFACTURE OF TOBACCO IN THE UNITED STATES.

Tobacco is manufactured in all the states except Vermont and Wisconsin. In this branch of business 8384 persons are employed, and 3,437,191 dollars of capital invested. The value of the product is 5,819,568 dollars, nearly one-half of which is in Virginia. The following table shows the states in which it is manufactured to any considerable extent.

STATES.	Hands.	Value.	STATES.	Hands.	Value.
		dollars.			dollars.

The export of tobacco from the United States since 1821 has nearly doubled, but the increase has been chiefly to Holland and Germany; while to Great Britain the export has not increased to any great amount; although the population has increased in the United Kingdom about 7,000,000 of inhabitants during the twenty years, 1821 to 1840.

The consumption of tobacco, per head, as charged with duty, has greatly decreased

since the commencement of the present century, in proportion to the increase of duty. Parliamentary tables furnish us with the following statistics in relation to this matter:—

CONSUMPTION of Tobacco in Great Britain.

Y E A R S.	Consumed.	Duty per lb.	Population.	Average consumption per head.	Amount of Duty received.
	lbs.	s. d.		oz.	£
1801.....	10,514,998	1 7 6-20	10,942,646	15.37	923,855
1811.....	14,923,243	2 2 13-10	12,596,803	18.95	1,710,848
1821.....	15,983,198	3 0	14,391,531	14.43	2,630,413
1831.....	15,350,018	3 0	16,539,318	14.84	2,338,107
1841.....	16,380,893	3 0	18,532,235	14.52	2,716,217

This presents a constant decrease in the consumption, per head, but the result in the case of Ireland is much more marked—as follows:—

Y E A R S.	Consumed.	Duty per lb.	Population.	Average consumption per head.	Amount of Duty received.
	lbs.	s. d.		oz.	£
1801.....	6,389,754	1 3 1-10	5,451,002	18.95	285,482

The highest consumption for the United Kingdom was, it appears, in 1811, when the abundance of depreciated bank paper, then serving as a currency, made the tax comparatively light. In 1821, both the rate of duty was enormously increased, and the currency enhanced by the resumption of specie payments by the Bank of England. Hence the enormous falling off in the consumption in that year, both in England and Ireland, more particularly in the latter country. Since then the currency has become better adjusted, and the consumption has increased under the same tax. Now the exports of tobacco to England, with the total export in each year, has been as follows:—

TOBACCO Exported from the United States to England.

YEARS.	Quantity.	Total from United States.	Value.	YEARS.	Quantity.	Total from United States.	Value.
	hhds.	hhds.	dollars.		hhds.	hhds.	dollars.

CHAPTER VI.

GROWTH AND PRODUCE OF COTTON WOOL IN THE UNITED STATES.

THE cultivation, growth, and uses of cotton wool, have become more important than the production of any other raw material, if iron may not be excepted.

Unknown to Europe until the tenth century, Asia alone, of the three *known* great divisions of the world, understood its use. In Africa it is indigenous, but its use, as a material to be woven into cloth, appears only to have been introduced

by the disciples and followers of Mahomet about the beginning of the fifteenth century. Its cultivation extended before the beginning of the sixteenth century over parts of Egypt, the Barbary States, and part of Guinea. Cotton, rice, the mulberry-tree, and the sugar-cane, were planted in Spain by the Moors during the tenth century.

In America, however, its use and manufacture appear to have been extensively known before the discovery of the western hemisphere by Europeans. Cook, alone, remarks that the *gossypium* is not indigenous in America. Columbus, Magellan, Van Noort, Dampier, and Drake,—say, that cotton was used, among other materials, for clothing. Columbus observes, that he saw cotton growing indigenous in St. Salvador; that he exchanged beads and brass for cotton yarn; and that the women wore short cotton coats. Cortez sent Mexican “cotton clothes of exquisite fabric, dyed in various colours,” among other presents to Charles V. Cotton is said to have been found growing wild and in great plenty in the Lower Mississippian regions.

The cultivation of cotton, however, as an article of merchandise to be exported from America, does not appear to have been introduced by Europeans until the middle, or end of the seventeenth century.

In 1726, cotton formed a staple export from St. Domingo. In 1733, it was cultivated by the Dutch in Surinam. Cotton was grown at the Cape Town settlements, in 1660 to 1666. “Cotton patches” were common in the settlements of Carolina about the end of the seventeenth and beginning of the eighteenth century.

In 1753, Jamaica exported 2000 bags, and, in 1768, to Great Britain and Ireland, 2211 bags of 200 lbs. weight, and to North America 252 bags. On an average of eight years, from 1740 to 1748, among the exports of Barbadoes 600 bags of cotton are included. In 1787, cotton was exported from the islands of St. Domingo, St. Christopher, Grenada, Dominica, Antigua, Montserrat, and Nevis, and the Virgin Islands. Before 1803, in which year Jamaica did not grow one bag for exportation, there were five varieties of cotton planted in the West Indies, viz: the common Jamaica, the brown bearded, the nankeen, the French or small seed, and the kidney or Brazil cotton: from which country cotton was first exported to England, in 1781. The interest on capital invested in the cultivation of cotton in the British West India islands, in 1785, 1786, and 1787, was fourteen per cent. In St. Domingo, where finer cotton was grown, the interest on capital was twenty-four per cent.

“Of the two kinds cultivated in the United States,” observes Mr. Seabrook,* “the ordinary green seed or short staple cotton is derived from the *Herbaceum* or herbaceous cotton, and the *Hirsutum* or hairy American cotton; the long staple or black seed cotton is derived from the *Arboreum* or tree cotton. The former was certainly grown in Virginia, in a limited way, at least one hundred and thirty years before the Revolution. Several of the early governors of that colony used diligent efforts to secure the fabrication of certain articles, which, it was believed, it could profitably raise; and the introduction and culture of new crops, among which was cotton; but their designs were thwarted, as well by the unjust and tyrannous conduct of the mother country, as by the opposition of the tillers of the soil, who, in a matter so important to themselves, had the boldness to consult what they held to be their true interests.” In Wilson’s account of the “Province of Carolina, in America,” published in 1682, it is stated “that cotton of the Cyprus and Malta sort grows

* In a recent valuable pamphlet on the cultivation of cotton, Charleston, South Carolina, 1844. Mr. Seabrook is president of the state Agricultural Society of South Carolina.

well, and a good plenty of the seed is sent thither." In Peter Purry's description of the province of Carolina (in Charleston, 1731), "flax and cotton" are said to "thrive admirably."* In the journal of Mrs. Pinckney, the mother of General Thomas and General Charles C. Pinckney, who, as Miss Lucas, when only eighteen years of age, was intrusted with the management of the planting interest of her father, the governor of Antigua, there is the following memorandum :—"July 1, 1739. Wrote to my father to-day a very long letter on his plantation affairs—on the pains I had taken to bring the indigo, ginger, *cotton*, lucerne, and casada to perfection, and that I had greater hopes from the indigo than any other. June, 1741. Wrote again to my father on the subject of indigo and *cotton*." In 1736, as far north as the 39th degree, cotton was cultivated as a garden plant near Easton, on the eastern shore of the Chesapeake bay. About forty years afterwards, it was cultivated in St. Mary's county, Maryland, and in the county of Cape May, New Jersey; also in the county of Sussex, Delaware. Mr. Jefferson, in his "Notes on Virginia," written in 1781, says, "During this time we have manufactured within our families the most necessary articles of clothing. Those of cotton will bear some comparison with the same kinds of manufacture in Europe; but those of flax, hemp, and wool, are very coarse, unsightly, and unpleasant."

Mr. Seabrook observes :—"A short time before the Revolution, a few of our planters, by growing patches of cotton, some of which was of the black seed kind, succeeded in clothing, not only their families, to which they had been accustomed, but also their slaves. The necessities of the war, and the state of things existing for some time after it, greatly increased the number of the domestic fabricators of the wool, until about the year 1790, when the practice of using homespun for plantation purposes became very common in the districts and upper parishes. The yarn was spun at home, and sent to the nearest weaver. Among the manufacturing establishments, the one in the vicinity of Murray's ferry in Williamsburg, owned by Irish settlers, supplied the adjacent country. The cotton for the spinning process was prepared in general by the field labourers, who, in addition to their ordinary work, picked the seed from the wool, at the rate of four lbs. per week."

At the Convention at Annapolis, in 1786, Mr. Maddison remarked, that "from the garden practice in Talbot, and the circumstances of the same kind abounding in Virginia, there was no reason to doubt that the United States would one day become a great cotton producing country." During the revolutionary war, Philadelphia was supplied with native cotton, at two shillings sterling per lb., sufficient for home consumption. A mission was sent the same year to England by Mr. Tench Cox, to obtain machinery, and all information relative to the spinning and weaving of cotton. *Protection*, the bane of manufactures, was then legalised. Mr. Seabrook remarks :—"The influence of a manufacturing society, established in Philadelphia, in 1787, and the prevalent opinion, that the raw material might be made a profitable source of revenue, induced Congress, at the first reformation of the tariff, to impose a duty of three cents a pound on foreign cottons, with which the United States were at that time supplied from the West Indies and the Brazils." He further remarks that—

"In 1792, the growth of cotton in the United States was unknown to Mr. Jay, or that as a commercial article it was deemed of little value, is obvious from the fact, that, in the treaty negotiated by him, it was stipulated, 'that no cotton should be imported from America.' The object being to secure to the English the carriage of the West India cotton to its market in Europe. For which reason the Senate refused to ratify the 12th article of that treaty. The first Provincial Congress in Carolina, held in January, 1775, recommended to the inhabitants to plant cotton, but their recommendation was almost entirely disregarded."

In the provincial trade returns, we find that among the exports of "Charles Town" from November, 1747, to November, 1748, were seven bags of cotton wool, valued at 3*l.* 11*s.* 5*d.* per bag. In 1754, "some cotton" was exported from South Carolina. In 1770, there were

* "Peter Purry, a native of Switzerland, and the founder of Purrysburg, in the reign of George I., presented a memorial to the Duke of Newcastle, then Secretary of State, in which he sets out with this postulate, that 'there is a certain latitude on our globe, so happily tempered between the extremes of heat and cold, as to be more peculiarly adapted than any other for certain rich productions of the earth,' among which silk, *cotton*, indigo, &c., and he fixes on the latitude of 33 deg., whether north or south, as the one of that peculiar character."

shipped to Liverpool, three bales from New York, four bales from Virginia and Maryland, and three barrels full of cotton from North Carolina. Before the revolutionary war, Virginia exported hemp, flax-seed, and *cotton*, to the value of nearly 2000*l*. In 1784, an American ship, which imported eight bags of cotton into Liverpool, was seized on the ground, that *so much cotton could not be the produce of the United States*. In 1785, fourteen bags; in 1786, six bags; in 1787, 109 bags; in 1788, 389 bags; in 1789, 842 bags; and, in 1790, eighty-one bags were exported to Europe from the United States. The first bag of cotton wool exported from Charleston to Liverpool, arrived January 20th, 1785, per *Diana*. The exports of cotton wool from the United States increased steadily, but the exports included West India cotton wools re-exported from 1790 to 1794. In 1796, the culture of cotton was greatly advanced by the invention of the *saw gin* by Eli Whitney, of Massachusetts. Mr. Seabrook observes, "This ingenious, but unfortunate artist, who by his machine doubled the wealth and means of employment of his countrymen, and thereby in an especial manner conferred on the plantation states a benefit that can scarcely be estimated in money, was rewarded by South Carolina, North Carolina, and Tennessee only. The first appropriated 50,000 dollars for the use of his invention within her limits; the second laid a tax for five years of 2*s*. 6*d*. upon every saw in every gin that was mounted within its jurisdiction; and the last imposed a tax of thirty-seven cents and a half upon every saw, to be continued for four years. Notwithstanding these liberal legislative acts, the inventor derived no pecuniary benefit from his gin. He expended the whole amount received from South Carolina (from the other states he received a mere pittance), in defending against arbitrary and vexatious suits, and in prosecutions for violations of his patent right. Over the grave of this distinguished benefactor of the human race, a monument is erected, with the simple inscription—'The inventor of the saw-gin.'

"The history of the green seed and the black seed cottons is intimately blended. The growing of the former in this country for exportation was begun but a few years before that of the latter;* the same machine for extracting the seed from the wool was for a long while employed; and the modes of cultivation and preparation, with one exception,† including the manner of packing the bales, were also the same.

"Between 1786 and 1795, cotton from various parts of the world was introduced into the southern states and Louisiana. A species of the white Siam was for some time the subject of experiment by the French in the latter country. The Nankeen came from Malta. The Bourbon was brought from that island to Charleston, through the instrumentality of James Hamilton, who was a merchant, and part owner of the only India ship at that time trading beyond the Cape of Good Hope. The Pernambuco or kidney cotton, was sent from the Havannah to Mr. Levett of Georgia, by a Mr. Welch, a merchant of Philadelphia. These, and many other sorts, after a fair trial, were abandoned, for the reason of their inferiority to the kinds then profitably raised, viz.:—the real green seed, and the Sea Island cotton; the latter having superseded the plant that was grown at the period of the Revolution, which strongly resembled the short staple in growth and blossom, except having a clean black seed with fur at the end. The Louisiana cotton, it is thought, was derived from this species, but degenerated in the progress of tillage by intermixture with other kinds. To a cross with Sea Island cotton, large quantities of which were shipped to Louisiana immediately subsequent to its cession to the United States, is, perhaps, in part to be attributed the decided superiority of the New Orleans cotton wool of the present day over all others in North America of the green seed description."

Sea Island, or *black seed cotton*, began to be raised in Georgia, in experimental quantities, in 1786. The native place of the seed is believed to be Persia. It is designated the

* "In Georgia the long staple cotton was first planted for market; in Virginia, South Carolina, and North Carolina, the short staple cotton.

† "The bow-string operation. A large bow, made elastic by a complication of strings, is put in contact with a heap of cotton; the workman strikes the string with a heavy wooden mallet, and its vibrations open the knots of the cotton, shake it from the dust and dirt, and raise it to a downy fleece. 'The bow,' says Mr. Baines, in his history of the cotton manufacture of Great Britain, 'has been used immemorially throughout all the countries of Asia, and has its appropriate name in the Arabic and other languages. In this country,' he remarks, 'it was first employed in Georgia; hence the term, still employed in commerce, 'Bowed Georgia cotton.'"

Persian cotton by Bryan Edwards, and is so called in the West Indies and by the merchants of England. The seed grown in this country came from the Bahama Islands, where it had been introduced by the Board of Trade from Anguilla.

"The *black seed cotton* region of Carolina is bounded on the north and north-west by a line about twenty miles south of the line that separates Barnwell and Orangeburg from the neighbouring parishes; on the north-east and east by the Santee river;* on the west and south-west by the Savannah river; and on the south and south-east by the ocean. The Eutaw Springs, in St. John's, Berkley, is the extreme northern point to which it extends. Williamsburg was for many years embraced in its limits, but that district no longer furnishes a supply of the raw material. About the year 1812, three or four planters, as an experiment, introduced its culture into the southern part of Sumter district. The quantity and quality of the crops were sufficiently encouraging, but as the preparation of the wool was objectionable, the growers abandoned their enterprise for the reason of the large expenditure of labour and time that it required. The first attempt in South Carolina to raise a crop of long cotton was made, in 1788, by Mrs. Kinsey Burden, of Burden's Island, St. Paul's parish. As early as about the year 1779, this and the short staple cottons were produced by her husband, whose negroes were then clad in homespun of home manufacture.† The first successful crop appears to have been grown by William Elliot, deceased, on Hilton Head, near Beaufort, in 1790, with five bushels and a half of seed, purchased in Charleston at the rate of 14s. per bushel. The cotton brought 10½d. per pound. In 1791, John Screven, of St. Luke's parish, planted thirty or forty acres at his Montpelier plantation on May river. The product was packed in the article called *Hessians*, and sold in Georgia for 1s. 2d. to 1s. 6d. sterling per pound. In 1792, John Rose cultivated a small field on the Oakatee creek, from which he gathered 600 lbs.; which commanded in the Savannah market 2s. a pound. It is certain that, at this period, many planters on the Sea Islands, and contiguous main land, *experimented with long cotton*, and probably it was produced by several of them for market. The season of 1793 found cultivators in other sections of the state engaged in the good work — among them, James King, of St. Paul's parish, Colonel Edward Barnwell, and Captain John Joyner, of Port Royal, and General William Moultrie, of St. John's, Berkley. The crop of Mr. King yielded abundantly, and was sold by Kinsey Burden, now of St. John's, Colleton, at 12d. to 13d. the pound; that of the latter, at his Northampton plantation, covering a field of 150 acres, was a decided failure. But to return. The cotton culture from this time progressed rapidly. In all the parishes the practical friends to its extension greatly multiplied. Against each other this plant and indigo struggled for the ascendancy. In 1798,‡ the latter was very generally ceased to be grown for market.

"As an evidence of the former value of this species of the gossypium, and of the success of some of its growers, it is worthy of record, that Peter Gaillard, of St. John's, Berkley, in 1799, averaged 78l. sterling per hand. In that year, James Sinkler, of the same parish, from a field of 300 acres, realised 216 lbs. per acre, for most of which he received 3s. a pound. William Brisbane, deceased, at his White Point plantation, St. Paul's parish, was so successful in 1796, 1797, and 1798, that from moderate circumstances he became, in his judgment, so independent, as no longer to engage in the toilsome task of cultivating the earth. He sold his landed estate to William Seabrook, of Edisto Island, at a price held by many to be ruinous to the latter,§ and passed a few years in travelling in our northern states and in Europe.

"While the larger portion of the seed used in South Carolina was either purchased in

* West of that line some green cotton is also grown.

† All attempts to naturalise the Bourbon cotton, though it strongly resembles the green seed species, have failed.

‡ At that early period, the opinion prevailed that the supply of cotton would soon exceed the demand. A highly respectable planter of St. John's, Colleton, deceased, in looking at his first crop, the produce of a few acres, after it had been housed, exclaimed, "Well, well, I am done with the cultivation of cotton! Here is enough to make *stockings* for all the people in America."

§ Mr. Seabrook, with the proceeds of the crops of the plantation, paid the purchase money in two years.

Charleston, or in Georgia, a considerable quantity was obtained in the Bahamas, through the active exertions of friends who resided in Providence.

"In 1780, when England had no fine manufactories, the best cottons brought to her market were from the Dutch plantations of Berbice, Demerara, and Surinam. These then commanded respectively 2*s.* 1*d.*, 1*s.* 11*d.*, to 2*s.* 1*d.*, 2*s.* In 1786, Bourbon cotton,* remarkable for fineness, but deficient in length, was worth from 7*s.* 6*d.* to 10*s.* per pound. It was superseded by Sea Islands, which, in 1799, sold readily in Liverpool at 5*s.* to 5*s.* 3*d.* per pound. Its price in this state, in the infancy of its production, was generally from 9*d.* to 1*s.* It soon rose to 1*s.* 4*d.* and 1*s.* 6*d.*—then to 2*s.* and upwards,† at which it remained until 1806, when the planter, for the first time, experienced the baneful effect of restrictions on commerce. From the superiority of this cotton to that raised in any other country, even from the same seed, the staple at first was objected to, as too long, and by one or two English spinners, it is said, it was actually cut shorter.‡

"On its introduction into Georgia, the cultivation of long cotton was confined to the warm high lands of the Sea Islands: these portions of the plantation are still everywhere preferred, and almost invariably return the largest yield, though their exhausted condition would seem to invite the more general tillage of the lower grounds.

"The method of cultivation was very various, and without method, until about the year 1802, when it assumed a regular form in Carolina and Georgia. Then the crop was worked four times—the latest hoeing being from the middle to the last of July. The hoeings now are more frequent, from five to seven being usually given, and are begun earlier, and finished sooner. The point appears to be conceded that, when the plant puts out fruit freely, which may be expected early in July, out-door labour should cease, especially if the season be wet.

"The plough was practically unknown to the first growers of long-staple cotton. This is still true, although a half century has elapsed. The ridge-system; the levelness of the ground, requiring, therefore, numerous drains; the small quantity of land, from three acres and a half to four acres, cultivated to the hand, which, from its lightness, is so easily and so much better attended with the hoe; and the impossibility of gathering the cotton as rapidly as the field may demand, if, with ploughs, the tillage embraced a larger number of acres—all seem to render the aid of this great agricultural implement utterly useless in the culture of the crop. In the breaking up of the soil, however, and, as an assistant, in forming the ridge, the plough is universally employed, except on the Sea Islands, where only, by a few planters, is its value, in the latter operation, fully acknowledged.

"The task in listing was formerly half an acre; in ridging, three-eighths of an acre; and in hoeing, half an acre. The present tasks are less, except in hoeing, which is the same. The beds are still changed as often as the same field is tilled. In Georgia, the attempt to make them so far permanent in low grounds as to continue for six or eight years, has, in a few instances, been successfully tried.‡ There is scarcely a doubt, from their

* Bourbon cotton was first imported into Manchester in 1783.

† From 1798 to 1809, both inclusive, a planter of this state sold his cotton in Charleston at the following prices:—

‡ "Twenty years ago," says Mr. Spalding, in a recent letter to the writer, "upon purchasing

depth of mould, and extreme richness in vegetable ingredients, that the experiment would succeed in the marsh lands of South Carolina. The application of this plan to poor soils is forbidden by the necessity of furnishing them annually with fertilising matter, which should be thoroughly incorporated with the earth.

“ Encouraged by the anticipated results of experience, if not in every instance by the actual product of their fields, our fathers continued to cultivate the grounds which their sagacity first selected for the new crop. After several years of exhausting tillage, a radical change in their plan of operations, it was apparent, must soon take place. Unaccustomed to imbibe information from books concerning their vocation, the plain alternative of resorting to virgin soils was adopted. This, with regret and mortification be it said, is still the popular expedient, except where necessity, that kind and blessed encourager of the arts, forces the reluctant to another, and, as experience testifies, far more profitable scheme. The land which could be the most readily prepared, was invariably chosen—the best, requiring a large expenditure of labour, neglected. Only recently have the swamps of some of the parishes, and the immense tracts which lie along the line where the salt and fresh waters meet, arrested the notice of the cotton grower. These alone are capable of yielding an amount of cotton wool equal to the yearly exports of the state. Whether the enterprise of the agriculturists is adequate to the task of draining and embanking them, the future will develop. To those who have been engaged in this patriotic work, the encouragement for further trials, on a more extended scale, is great, if not decisive.

“ Notwithstanding the woods everywhere, and the marshes, furnished an abundant store of suitable aliment, still, in his early efforts, the industry of the grower did not extend beyond the narrow limits of manuring his root potato field, comprehending the one-fourth of an acre to each labourer. There were no instruments to mow the salt grass, rakes for collecting leaves, nor carts especially designed to convey the vegetable offal to the cattle-pen. On Edisto Island, where the system of tillage is admitted to be good, and where, probably, as much enriching matter is distributed over the land as in any other part of the United States, there was, in 1822, not one plough or scythe; the largest plantations had not more than two or three carts, and the utility of oxen, in practice, was absolutely unknown. Now, a cart and mule, or a yoke of oxen, to every six workers, is common; labour-saving machines abound; and every acre of cotton, and generally of provisions, is provided with, what at least is supposed to be, a proper quantity of appropriate pabulum. This salutary reformation in the husbandry of this small section of the state was effected mainly by the establishment of an Agricultural Society in the year just alluded to. All that has been said in reference to Edisto, is applicable to most of the Sea Islands, and, in a more limited sense, to a majority of the parishes.

“ In Carolina, it was not until about 1825, that manuring may be said to have been systematised. By the force of circumstances, the sea-board set the example,* which, though strongly urged by the slender return of their fields, is still apparently unheeded by many of the parishes and districts.

“ Of all the fertilising materials for the black seed cotton, marsh mud is held in the highest estimation; not for the reason of its abundance and contiguity to plantations, but because, if the proper kinds † be judiciously used, it is the most profitable, and certain in its results. It contains more nutritive and other valuable properties than any other natural compound, and is specially adapted to light sandy soils.

“ Salt mud, as a garden manure, was employed in South Carolina in 1801. Judge William Johnson states, that in that year he commenced his experiments with it, and, after repeated trials, arrived at the conclusion that it was a great meliorating agent. It is said, that as far back as 1797, the late General Vanderhorst was practically acquainted with its value. The merit of its discovery, however, as a fertiliser for cotton lands, seems to be due

some river-land opposite to Savannah, I adopted permanent ridges, planting a row of corn, and a row of cotton alternately; these ridges had stood nine years, when my son sold the plantation, giving, as I think, the best cotton and the best corn crops in Chatham county.”

* In 1805, nearly all the materials, now used as manure, were then employed on the Sea Islands, though in a very limited way.

† That on which the tall marsh grows is greatly to be preferred to all other kinds.

to the late James King, of St. Paul's parish. By him it was freely used before the late war with Great Britain.

* As slovenly as was originally the tillage of the cotton plant, the preparation of its produce for market was much more so. It was, indeed, so badly cleaned, as to be deemed suitable only to the coarser fabrics. Up to about the year 1820, the gatherers took no especial pains to abstract the decayed leaves. The wool was sunned all day, and ginned frequently with the stained particles incorporated with it. These were removed in the process of moting, which was effected by women sitting on the floor, where it was beaten with twigs. During the operation of ginning, no bags or boxes received the cotton, and oftentimes large quantities were thrown together until the moters were prepared to examine them. In packing, an old iron axletree, or wooden pestle, the present instrument, was used. There were no re-inspectors of the cotton before it was deposited in the bag, in which the spinner would frequently find, in addition to a large supply of leaves and crushed seeds, potato skins, parts of old garments, and occasionally a jack-knife. With many, the cotton was ginned, moted, and packed in the same room. Very different indeed are the present processes, or rather the modes in which they are severally performed. Separate rooms for the seed and ginned cottons, as well as for the wool, which, after it is gathered, is never exposed to the sun, have long been considered necessary, in the sea-board parishes, to ensure the proper after-handling of the crop. There are required a room for the whipper, if one be employed, which extracts the dirt and imperfect filaments; another for the assorters, who, provided with boxes for their clean cotton, perform their work before a long table, covered with wire, or wooden slats, the eighth of an inch apart; a third for the moters, who also stand before a latticed table, and, as often as a handful of cotton is prepared, it is thrown into a wooden box, about three feet from the floor, and secured to the sides of the building immediately behind the moters respectively; a small room for the moted cotton, and one for the packer, usually adjoining it; and a house or room, proportioned to the force employed, for the ginners, in which are boxes for the seed cotton in the rear of the operators, and boxes under the machines for the ginned cotton. The houses are lined on the inside with planed boards, and the windows of the assorting and moting rooms, and the gin-house, are glazed. All these accommodations are now to be found on nearly every plantation on the Sea Islands and the adjacent country, and, it is said, in many of the upper parishes.

"The amount of labour expended in a day in preparing one bag of superfine cotton, of 300 lbs. weight, the produce of 1500 lbs. in the seed, is as follows, viz. :—

Dryer	1
Turner and feeder of the whipper	2
Assorters, fifty lbs. each,	30
Ginners, twenty-five lbs. each,	12
Moters, forty-three lbs. each,	7
Packer and re-inspector	2
Total	54

"It will thus appear, that if the foot-gin be used in the ordinary way, which, with a few exceptions, is the invariable practice, fifty-four labourers, at an expense to the owner of twenty-seven dollars, estimating their services at fifty cents per day respectively, are necessary to the getting of one bag of cotton properly cleaned. When the gins are propelled by steam, six persons only, male or female, to feed them, are required. If the wool be separated from the seed by Eaves's improved gin, to which steam power is applied, the aid of three men will be needed. In all other respects the labour is the same.

"The cultivation and preparation of cotton, as described in these pages, is peculiarly applicable to the southern half only of the long staple region. In the northern portion, but especially in the Santee country, there are differences in each, which it is important should be briefly noticed. Five acres to the hand, of which generally only one-third is manured, are planted. The ridges are four feet from each other, and the plants stand from fifteen to twenty inches apart. In the culture of the crop, a machine of a triangular shape, called 'the sweep,' is used by a few as an assistant to the hoe. The morning after the cotton is gathered, according to the wonted usage, it is assorted by the pickers; but, con-

trary to the plan of the sea-board, not afterwards ; unless one or two hands, who attend to the scaffold, may be said to perform that service. The task in moting is from twenty to twenty-five lbs. The material points of difference, then, in the handling of the crop, between the lower and upper parishes, or the former and Santee growers, consist in the processes of assorting and moting. The labour of the first is chiefly expended in cleaning the cotton in the seed ; that of the other, after it is ginned. This, probably, arises from the characteristic features of the two staples. Unless great caution be exercised in the moting of fine cottons, the fibres will entangle, and the wool become lumpy and stringy. These results do not take place when the coarser qualities are cleaned in the ginned state.

“ For the silky cottons produced on the Sea Islands of South Carolina, the planter is indebted to the botanical skill and laudable perseverance of Kinsey Burden, Sen., of St. John's, Colleton. An improvement in the texture of the wool engaged his earnest attention as early as 1804 or 1805. In one of those years, he raised from selected seed a ‘ pocket’ of cotton, worth, in the English market, ‘ twenty-five cents per lb. more than any other cottons at any price.’ From that time he laboured zealously in this new branch of his profession until 1826, when he sold his first full crop, sixty bags, at 110 cents per lb. The crop of the following year commanded 125 cents per lb. It is proper here to observe, that between 1821 and 1829, the average price of common long cotton was twenty-four cents, and of the superior kinds from thirty-five to sixty cents. Mr. Burden's discovery was held to be so valuable to the state, that he was induced to forward a memorial to the legislature, offering to sell his secret for 200,000 dollars ; he resigning all his seed, except what was necessary for his own crop, and communicating the mode of perpetuating the silky properties of the new cotton fibre. The memorial, for reasons satisfactory to the applicant, was never presented.

“ Cotton may appropriately be divided into three kinds : 1st, Herbaceous cotton ; 2nd, shrub cotton ; 3rd, tree cotton. The first is the most useful, and is cultivated in nearly every country congenial to the *gossypium*. It exists native at Aleppo, in Upper Egypt, Arabia, and in Senegal. Of the seven varieties of the shrub cotton, one or other grows spontaneously in the tropical regions of Asia, Africa, and America. In the latter continent, the *hirsutum*, or hairy (seeds greenish), and the *Barbadense*, or Barbadoes cotton (a black seed), are indigenous. To the shrub species all the South American, and most of the West India cotton, which is long-stapled, is to be referred. The tree cotton, according to one authority, grows in India, China, Egypt, the interior and western coast of Africa, and in some parts of America ; by another, it is a native of India, Egypt, and Arabia.

“ Quatremere Disjoulal, a prominent member of the Academy of Sciences of Paris, in speaking of the influence of climate on the texture and quality of cotton, advances the following hypothesis :—That the produce of the countries immediately under or nearest the equator, is to be considered the type of excellence, and is distinguished by its fine silky fibre, the depth and peculiarity of its colour, and the height and permanency of the plant. In proportion, he remarks, as we recede from the equator, these strongly marked characters disappear, the fibre becomes coarse, its colour perfect white, and, on the shores of the Mediterranean, we behold the lofty and flourishing tree of Hindostan, dwindled down into a stunted annual shrub. Of these broad and unqualified assertions, there is but one that rests on a tenable basis :—that the perennial plant of the equator becomes an annual in a higher latitude. The averment, that the finest and the deepest coloured cotton is the produce of the tropical countries, is reiterated on even higher authority.* This is false, as a general proposition, and only true concerning locations. The coarsest cottons known in commerce, except some from Peru, between 5 deg. and 15 deg. south, which are of a dark hue, and as coarse as the wool of sheep, are the Bengal, 24 deg. north, and the Surat, 21 deg. 10 min. north ; the finest, and in all other respects the best, cottons are produced on the Sea Islands of South Carolina, 10 deg. beyond the Tropic of Cancer. To the latter, as well as those of the Isle of France, 20 deg. 9 min. south, Dacca, 23 deg. 55 min. north, and Egypt, about 30 deg. north, the cotton of Guiana, within 5 deg. of the equator, is decidedly inferior. The worst native cotton in the East grows in Java, 7 deg. south. The cottons of South America, in the hottest region, it is true, are of a better quality than

* “ Rees' Encyclopædia ;” article *Cotton*.

those of the Levant ; on the other hand, some of the West India kinds are lower in value than the green seed varieties of this country. These too, as is especially the case in our state, oft-times grow within a few miles of the long-staple cotton, and, in certain localities, side by side ; yet the best sorts of the latter are worth 800 per cent more than the best sorts of the former. So much for the effect of climate on the fibre of cotton, in opposition to the gradation of the French philosopher's system. With regard to the colour of cotton, the yellowish hue of which is indicative of fineness, climate has but an inconsiderable effect. The cottons on the coasts of South Carolina and Georgia are tinged, and some varieties deeply, with yellow ; while the inland districts of those states, and their more southern neighbours, as far as the Red river, produce cotton of great whiteness, and far inferior in strength and fineness. A portion of the West India cotton is of a cream colour ; and some from India is represented to have 'a slight tinge of Aurora.' The cottons of Bengal, Madras, and Surat, of Smyrna, Cyprus, Salonica, and all parts of the Levant, are distinguished by their want of colour ; this is also said of Siam, famous for its nankeen. The Dacca cotton is deeply coloured, and, although it is consumed in that province, and consequently unknown in commerce, still, from an examination of the muslin, denominated in hyperbolic language, 'webs of woven wind,' and 'which can hardly be felt when expanded,' it has been satisfactorily ascertained to be of a coarser fibre than the better qualities of our cottons, grown near the ocean. While one pound of that cotton, in a single thread, would extend to the distance only of 115 miles, two furlongs, and sixty yards, cotton yarn is spun in England, making 350 hanks to the lb. weight, each hank measuring 840 yards, and the whole forming a thread of 167 miles in length. Further, 420 hanks certainly, and, it is asserted, from 480 to 500 hanks, per lb., have been spun in Manchester with cotton from South Carolina ; thus yielding a thread from 197 to over 238 miles long.

"The valuable properties of cotton wool, in their relative order, are strength, fineness, length, evenness and freedom from knots and entanglements. The superiority of our Sea Island cotton over all other kinds, * is owing to their fibres being 'spiral springs, singularly adapted to the spinning process, readily entwining with, and sliding over, each other, during the formation of a thread, with an easy elastic force. The filaments of these cottons vary from one to two 'inches, and in breadth from 1-1500th to 1-3000th of an inch.'

"A short time after cotton, as a crop, had been successfully cultivated in Carolina, it was attacked, in Georgia, by the caterpillar, *noctua xyliana*, or cotton-moth, which made its appearance as early as 1793 ; seven years afterwards, in South Carolina. In 1804, the crops, which would have been devoured by them, were, with the enemy, effectually destroyed by the hurricane of that year. In 1825, the visit of the worm was renewed, and its ravages were universal and complete. In 1827, 1829, 1833, 1834, 1840, 1841, and 1843, the lower parishes generally, or particular locations, suffered greatly by its depredations.

"That the cotton-moth frequently survives the frosty season, is nearly certain. An examination of the neighbouring woods, especially after a mild winter, has often been successfully made for that purpose.

"The injury that has often been committed by the caterpillar is almost incredible. In one week they have denuded of its foliage every stalk in the largest field. The cotton plant of Guiana was very subject to the attack of the chenille, as the caterpillar is there called. In the Bahamas, between March and September, 1788, no less than 280 tons of cotton, on a moderate scale, were devoured by this worm. Among the causes of failure of the crop in that quarter, as ascertained by answers of the most intelligent and experienced planters to questions proposed by the House of Assembly, the most prominent is the destruction by the chenille. The same cause produced the abandonment of the gossypium culture in several of the West India islands.

"The attack of the caterpillar in Carolina is not annual. This of itself is satisfactory evidence, that the 'evolution of the larvæ, and the transformations and death

* Ten years ago, the difference between the staple of our Sea Island cotton, and that of Egypt, Brazil, and some of the West India sorts, was about twenty per cent in favour of the former. Owing to a more favourable climate, superior husbandry, and the raising of superfine qualities, the difference may now be estimated at from thirty to fifty per cent, and over, if the silkiest kinds be included.

of the insect, or the appearance and disappearance of the chenille, are regulated or influenced by particular states of the atmosphere; and probably, as close observers have remarked, by 'the phases or changes of the moon.' Every effort which the most scrutinising and active minds have hitherto suggested to prevent their propagation, or to render innoxious the career of these insatiable depredators, has utterly failed. From this consideration, added to their great tenacity of life and extraordinary fecundity, it is supposed that the ordinary means of effecting either of those desirable ends will never succeed. The caterpillar, after being plunged into spirits of turpentine, or corrosive sublimate, is as ready for his all-day meal, as though it had been immersed in pure water. If the section of the field in which the pupæ only are seen, be burnt, the progress of the worm, as experience testifies, will scarcely be impeded. Lime will quickly produce death, and so will oil rubbed on the abdomen, but how can these be used efficaciously on the larvæ, when from 500 to 1000 on a plant are not unfrequently seen? Or can the pupæ, reposing in their glutinous cells, be affected by any external application? In this way the planter reasons, and when the enemy appears, no means whatever are now employed to preserve the fruits of his labour."—*Mr. Seabrook on the Cultivation of Cotton.*

Mr. Townsend, of Carolina, adopted the following plan for destroying these insects:—

1. His people searched for and killed both the worm and the chrysalis of the first brood.

2. On the appearance of the second brood, he scattered corn over the field to invite the notice of the birds, and while they depredated on the worms on the tops of the stalks and their upper limbs, the turkeys destroyed the enemy on the lower branches.

3. When in the aurelia state, the negroes crushed them between their fingers.

4. Some patches of cotton, where the caterpillars were very thick, and the birds and turkeys could not get access to them, were destroyed.

5. The tops of the plants, and the ends of all the tender and luxuriant branches, where the eggs of the butterfly are usually deposited, were cut off.

"By these means, resolutely pursued, although at one time the prospect of checking the depredators was almost cheerless, not the slightest injury to the field was sustained.* As the reasons for the measures adopted by Mr. Townsend are, perhaps, apparent, it behoves the planter to reflect that, on the first visit† of the caterpillars, while their number is few, they might be, if not entirely got rid of, materially lessened; that in the pupæ state they are easily detected, and, of course, as easily killed; and that while early and indefatigable exertions may be crowned with success, delay or tardiness in his operations will certainly be fatal.

"In Georgia, the attack of the red bug, a winged insect with a long proboscis, with which it pierces the green pods, extracting the juices of the seed, and leaving the capsules blighted and hard, and the cotton stained of a deep yellow or red colour, are coeval with that of the caterpillar. Although this insect is an occasional depredator in the fields of this state, yet no material loss has been sustained by it. This is, also, true of the *apata monachus*, a species of the scarabe, the larvæ of which, eating with a revolving motion, penetrate to the wood and pith of the cotton stalk. Red bugs, that prey on the roots and leaves of cotton, usually early in May, though their appearance is not uncommon in April, are certainly becoming more destructive and extensive in their visits. By the latter, the growth of the plant is in general only checked; but the former,‡ by arresting the ascent and circulation of the sap, generates a disease, which, if it do not destroy, renders the plants comparatively barren. The grub or cut-worm, if the spring be cold, and east winds prevail, is a troublesome, but not a formidable, enemy. The blast or blight is now, perhaps,

* The experiment cost Mr. Townsend two acres and a half of cotton, about fifteen bushels of corn, and the work of all his people for about five days. This gentleman was roused to unusual action by the reflection, founded on analogical reasoning, that, of one moth of feeble wing and tender body, which a vigilant eye might discover and destroy, the progeny in six weeks amounted to at least 26,000,000 of worms.

† This is communicated to the planter through the sense of smell. When the chenille appears, a very flagrant odour issues from the field, which is not possessed by the worm itself, or the plant separately.

‡ Wherever salt is applied on the listing, at the rate of one pint to the task-row (105 feet), it is confidently believed, that the bug will not appear.

the most common of all the diseases to which cotton is liable. Its tendency is to check or destroy the vegetative powers of the plants. The causes of blast are threefold:—excess of vegetation, corresponding with plethora in animals; exhaustion of vegetation, terminating in a state similar to gangrene; and wetness at the roots. When the first takes place, the cotton is pronounced ‘flaggy;’ the appearance of the second is denominated ‘canker,’ of which there are two kinds: in one the plant is stripped of its fruit and foliage, except a few green buds on the top; in the other, the leaves wither—the stalks assume a dark hue, and the pods drop, save those nearly full grown, which become hard and black, though they produce cotton. In relation to the third cause, as long as the roots are saturated with water, the procreative energies of the plants are arrested, and all the fruit previously formed quickly disappear. While the manuring system, where judiciously practised, has almost effectually removed one cause, and the main one, arising from vegetative exhaustion,* it has palpably increased the plethoric habits of the plant, and multiplied the number of its diseases, most of which, there are good grounds for believing, is animal. It should, hence, be the paramount duty of the grower, unless an antidote, like salt for instance, be applied, to use sparingly those manures, which furnish a matrix for generating or nourishing the insect brood.

“It has been well said by a judicious observer, that, of all the productions to which labour is applicable, the cotton plant, more particularly the species grown on the Sea Islands, is the most precarious. In its first stage it is attacked by the grub; it is devoured by bugs in the second; and by caterpillars in the third: it is often withered by the wind in its infancy, and by the blight in maturer age; and when the grower, excited by all the causes which hope so kindly presents to his ardent imagination, is about to reap the golden harvest, an equinoctial gale, or a few saturating showers, deprive him at once of the fruits of his labours, and bid him to reassume the toils and vexations of his vocation. And here it may pertinently be added, that ‘when the produce is raised, at an expense to the cultivator, which, perhaps, is not equalled in any other pursuit—an expense, too, that is permanent and certain, while the returns are more variable and fluctuating than any other—the selfish and grasping policy of man is oftentimes more destructive than even the anger of Omnipotence.’

“Apart from the suicidal legislation of the federal authorities, our planters have no cause for despondency. Every view of the subject, on the contrary, imperiously invites them to persevere. In confirmation of this assertion, there are two considerations, one of a general and the other of a local character, to which I would briefly invite your notice—the first showing, that better and cheaper cotton can be grown in this country than in any other section of the world; the other, that by a little more attention to the processes that succeed the gathering season, the disparity between the South Carolina planter and his more southern associates, in relation to the money value of their respective crops, would be considerably lessened. And, first, in reference to nearly every part of the globe where cotton is grown for European consumption and manufacture, it is undeniable, that while the production of the raw material in the United States is rapidly extending, in other countries, it is either stationary or diminishing. Secondly, although with regard to the amount of cotton per acre, South Carolina cannot compete with the Gulf states,† yet her planters, in consequence of this apparent misfortune, are enabled to send the wool to market greatly improved in value by a superior mode of handling. One cent more per pound, occasioned by a better style of preparation, taking the crop of the last year as a basis, would yield to the growers over 900,000 dollars.

* Sometimes, on poor high land, assisted with any matter, salt-mud especially, that brings the plant rapidly to maturity, this disease will appear, if a drought be succeeded by heavy rains in August. To prevent this, do not use mud alone, but in connexion with some stimulating aliment. Such lands should not be planted until the last of April.

† While the production in the Gulf states has doubled itself for the eighteen years, from 1824 to 1841, inclusive; that of the southern Atlantic states for the same period has remained nearly stationary.

Actual average of the eighteen crops from 1824 to 1841 :—

	First Six Years.	Second Six Years.	Third Six Years.
South Atlantic States	253,000 bales.	504,000 bales	1,030,000 bales.
Gulf States.....	433,000 „	522,000 „	529,000 „

"The American saw-gin, and the wonderful discoveries and inventions in England in the operations of carding, spinning,* and weaving cotton, gave birth to the cotton-husbandry in the United States. The application of steam to the propelling of the cotton-machinery, and for purposes of navigation; the improvements in ship building, which enable vessels that formerly carried only 900 lbs. to the ton of register, now to carry from 1500 to 2000 lbs. to the ton, separate from the skill and industry of the cultivator, have materially contributed to its unparalleled extension.

"In consequence of its abundance, and the facility with which it can be twisted into a thread, cotton is the cheapest of all the materials for clothing; and what, perhaps, is of scarcely less importance, it is in a high degree conducive to health. For these reasons, it is gradually supplanting flax, silk, and wool, as an article of wear, or forms a component part of all of them.† From its exchangeable value, and constituting as it does more than one-half of our exports,† it has greatly accelerated the growth and flourishing condition of the plantation states; aided to build up the prosperity of their political associates, and added vastly to the wealth and greatness of the union. Nor has its benefits been confined to the North American republic. The enlargement of our cotton husbandry, by arousing the energies of the British artists, created many of those extraordinary mechanical improvements, which have essentially contributed to render England the most powerful nation of which history furnishes an example. The community of interests existing between that sea-girt isle and our highly favoured land, owes its strength and maintenance to the downy fleece of a long-neglected shrub, which, by the unexampled skill and ingenuity of the one, and the untiring industry and perseverance of the other, has become 'the wonder of agriculture in the United States,' and the miracle of manufacture in Europe.' Without attempting to show the manifold blessings that cotton has conferred on the political and social condition of other nations, it may, perhaps, be only necessary to remark, that everywhere society feels its friendly and invigorating influence. All classes and occupations, though its culture and manufacture, on an extended theatre, are of modern date, already acknowledge, that the 'vegetable wool' is among the greatest gifts of God to His people.

"The grand revolution which has increased the production of cotton wool in this country over 5676 times in half a century, has been brought about not by governmental patronage and the influence of monopolies, but against the unceasing plunderings of the one, and the resistless and unrelenting fiat of the other. The history, indeed, of no pursuit affords so extraordinary a result from the isolated labours of its followers, and under circumstances so oppressive and discouraging, as that of the cotton grower of the United States. He sows, and endures the heat and burden of the day, but others riot in the harvest. A juster and nobler policy, it is hoped, will ere long direct the federal councils. 'England now pays to America 35,000,000 dollars per annum for a single product of our fields. To keep her in this position is a task of easy accomplishment, if commerce be free, and the planter be released from the shackles of pernicious and unwarrantable enactments. As an exporter of the main crop of both countries, Texas can never be the rival of the United States, unless the spirit that has so long swayed the constituted authorities of the latter shall unfortunately continue in the ascendant.' Under the guidance of a patriotic home legislation, and international interests, these coterminous communities would constitute the region, which might abundantly supply the nations of the globe with its great staple commodity, and at a lower rate, too, than ever was done by the labour of man."—*Mr. Seabrook on the Cultivation of Cotton.* * *

In 1791, about 2,000,000 lbs. were grown in the United States—of which about 1,500,000 lbs. was the produce of South Carolina, and about 500,000 lbs. of Georgia.

In 1801, the cotton crop of the United States was about 40,000,000 lbs.—of which about

* "Of the inventions of the 'water frame' by Arkwright, the 'spinning jenny' by Hargreaves, and the 'mule jenny' by Samuel Crompton, the two first occurred a short time before the American Revolution—the last in 1779. 'Of the four great divisions of the globe,' remarks Mr. Baines, 'Europe was the last to receive the cotton manufacture, and England was among the last to engage in that branch of industry.'"

† "The total value of the exports of the produce of the United States, during the year, ending on the 30th of September, 1841, was 106,382,722 dollars. Of this, cotton furnished 54,330,341 dollars, or more than one-half. South Carolina, as her share, contributed 8,041,392 dollars."

20,000,000 lbs. was produced in South Carolina, about 10,000,000 lbs. in Georgia, about 5,000,000 lbs. in Virginia, about 4,000,000 lbs. in North Carolina, and about 1,000,000 lbs. in Tennessee.

In 1811, the crop of the United States was estimated at 80,000,000 lbs.—of which 40,000,000 lbs. in South Carolina, 20,000,000 lbs. in Georgia, 8,000,000 lbs. in Virginia, 7,000,000 lbs. in North Carolina, 3,000,000 lbs. in Tennessee, and 2,000,000 lbs. in Louisiana.

In 1821, the produce of the several cotton growing states was distributed as follows,—South Carolina, 50,000,000 lbs., Georgia, 45,000,000 lbs., Tennessee, 20,000,000 lbs., Alabama, 20,000,000 lbs., Virginia, 12,000,000 lbs., North Carolina, 10,000,000 lbs., Louisiana, 10,000,000 lbs., and Mississippi 10,000,000 lbs. Total crop about 170,000,000 lbs.

In 1826, the total produce of cotton in the United States was about 348,500,000 lbs. Georgia produced 75,000,000 lbs., South Carolina 70,000,000 lbs., Tennessee 45,000,000 lbs., Alabama 45,000,000 lbs., Louisiana 38,000,000 lbs., Mississippi 20,000,000 lbs., Virginia 25,000,000 lbs., North Carolina 10,000,000 lbs., Florida 2,000,000 lbs., and Arkansas 500,000 lbs.

In 1833, the cotton crop of the United States increased to about 437,750,000 lbs.; viz., Georgia 88,000,000 lbs., South Carolina 73,000,000 lbs., Mississippi 70,000,000 lbs., Alabama 65,000,000 lbs., Louisiana 55,000,000 lbs., Tennessee 50,000,000 lbs., Florida 15,000,000 lbs., Virginia 13,000,000 lbs., North Carolina 10,000,000 lbs., and Arkansas 750,000 lbs.

In 1834, the crop increased to 467,500,000 lbs.; viz., Mississippi, 85,000,000 lbs.; Alabama, 85,000,000 lbs.; Georgia, 75,000,000 lbs.; South Carolina, 65,500,000 lbs.; Louisiana, 62,000,000 lbs.; Tennessee, 45,000,000 lbs.; Florida, 20,000,000 lbs.; Virginia, 10,000,000 lbs.; North Carolina, 9,500,000 lbs.; and Arkansas, 500,000 lbs.

By a report of the secretary of the treasury to congress, compiled from the returns of the weight and value of cotton cleared at all the custom-houses of the United States, the average prices of cotton were as follows:—

1791 to 1800, average price was 33 cts.; highest average, 44 cts. in 1799, lowest average 28 cts. in 1793.
 1801 to 1810, " 22 " 44 " in 1801, " 16 " in 1810.
 1811 to 1820, " 20 " 34 " in 1818, " 10 " in 1812.
 1821 to 1835, " 12 " 21 " in 1825, " 9 " in 1831.

* From 1784 to 1790 inclusive, the number of bags exported was respectively 8, 34, 6, 109, 389, 842, 61, which are estimated as weighing 150 lbs. each.

† Some foreign cottons included.

‡ The bags from 1833 to 1842, inclusive, are estimated to weigh 330 lbs. each.

§ For the nine months ending the 30th of June.

EARLY IMPORTS OF AMERICAN COTTON, FROM THE UNITED STATES
INTO ENGLAND.

The first arrival of cotton-wool, the produce of the United States of America, took place at Liverpool, on the 20th of January, 1785, of one bag, per Diana from Charleston.

An account of the import of the first cotton brought to the port of Liverpool, the growth of the United States of America, 1785. January 20th, Diana, from Charleston, one bag; February 17th, Tonym, New York, one bag; July 21st, Grange, Philadelphia, three bags; November 17th, Friendship, Philadelphia, nine bags. Total, fourteen bags.

1786.—May 4th, Thomas from Charleston, two bags; June 21st, Juno, Charleston, four bags. Total, six bags.

1787.—April 5th, John from Philadelphia, six bags; June 7th, Irish Volunteer, Charleston, one bag; June 14th, Wilson, New York, nine bags; June 28th, Grange, Philadelphia, six bags; James Appleton, two bags; August 2nd, Henderson, Charleston, forty bags; December 13th, John, Philadelphia, George Goring, thirty-seven bags; Order, seven bags. Total, 108 bags.

Total import of cotton into Liverpool during the six years from 1785 to 1790, inclusive, was 1441 bags. Though the above statement shows a progressive increase, it appears that the demand was neither uniform nor extensive, the import, in 1789, having exceeded that of the following year 731 bags. From this period, however, the trade, especially as regards Liverpool, has increased with astonishing rapidity.

NUMBER of Pounds of Sea Island Cotton Exported from the United States.

(For further information relative to cotton, see hereafter Cotton Trade of the United Kingdom and of Europe generally.)

GROWTH OF SILK.

The mulberry and silk worm were introduced into Virginia, South Carolina, and Georgia, about the middle of the eighteenth century. Dr. Franklin and others made successful experiments in Pennsylvania in rearing silkworms. At a public filature in Savannah, Georgia, the following deliveries of native cocoons were made: 1052 lbs. in 1757, and during each of the three following years, 7040 lbs., 10,000 lbs., and 15,000 lbs. By referring to the general table of products of agriculture in 1840, it will appear that the total weight of silk cocoons produced amounted to 61,552 lbs.; and an increased trade in mulberry trees has been carried on, with various success, for some years. Bounties have been granted by the state legislature, silk journals published, speculations for growing mulberries and raising silkworms, and "the *Multicaulis* speculation," *par excellence*, became a mania, until the disastrous stoppage of the banks in 1839,

proved nearly ruinous to the rearing of mulberry plants. Most of the silk companies then in existence were ruined; notwithstanding bounties and *state protection*.

Since 1840, the culture of silk appears to have recovered itself. The soil of the United States is extensively and well adapted for growing the mulberry; and the climate, notwithstanding its variable character, is sufficiently favourable for rearing the silk worm. The silk produced is of superior quality.

The following extracts from Mr. Ellsworth's Official Reports for 1842, 1843, and 1844, and from statements in *Hunt's Merchants' Magazine*, embrace all that we can state relative to the silk culture of the United States.

"Notwithstanding," says Mr. Ellsworth, "the disappointment of many who, since the year 1839, engaged in the culture of the *morus multicaulis* and other varieties of the mulberry, and the raising of silkworms, there has been, on the whole, a steady increase in the attention devoted to this branch of industry. This may be, in part, attributed to the ease of cultivation, both as to time and labour required, and in no small degree, also, to the fact that, in twelve of the states, a special bounty is paid for the production of cocoons, or of the raw silk. Several of these promise much hereafter in this product, if reliance can be placed on the estimates given in the various journals more particularly devoted to the record of the production of silk. There seems, at least, no ground for abandoning the enterprise, so successfully begun, of aiming to supply our home consumption with this important article of our imports. In Massachusetts, Connecticut, New York, Pennsylvania, Delaware, Tennessee, and Ohio, there has been quite an increase above the amount of 1839. The quantity of raw silk manufactured in this country the past year is estimated at more than 30,000 lbs. The machinery possessed for reeling, spinning, and weaving silk, in the production of ribbons, vestings, damask, &c., admit of its being carried to great perfection, as may be seen by the beautiful specimens of various kinds deposited in the National Gallery at the Patent Office. The climate of our country, from its southern border even up to 44 deg. of north latitude, is suited to the culture of silk. It needs only a rational and unflinching devotion to this object, to place our country soon among the greatest silk producing countries of the world."—*Report for 1842*.

"During the past year (1842) the silk business in this country has been steadily advancing. A greater interest is evidently felt in the subject; and the evidence is decisive, that it needs only patient perseverance to accomplish greater things than its warmest advocates have ventured to hope for. A well represented national convention on the subject was held at New York in October last, at the time of the fair of the American Institute, by the direction of which a great number of letters and communications from persons engaged in the business in all parts of the United States have been published in a pamphlet called 'The Silk Question settled.' The statements contained in this publication furnish the most complete view of the condition of the business of cultivation of the mulberry, raising and feeding worms, and the manufacture of silk, with the methods best adapted to success, that has before been presented to the public. Twelve states were represented by the appearance of a delegation in person, and communications were received also from the residents of eight more. From the various other information, as well as from this publication, it is evident that there has been an increase of attention to this crop all over the United States. In New England it does not probably equal that of some other sections of the country. Some scattered notices may help in estimating the crop of the first year; but much reliance will be placed on the publication just mentioned, and we shall endeavour to condense some of the important results and conclusions on account of their eminently practical bearing and utility. The greatest increase in the crop seems to have taken place at the west. The states of Ohio, Tennessee, and Indiana, have several enterprising men whose influence has been felt in urging forward this business, and the advantage is most encouraging. It is very difficult to fix on any ratio, and the estimated crop in the general tables of products for 1843 will probably, in many cases, fall far below the actual progress, but there is sufficient to show that there is a steady increase from year to year. In the New England states, Connecticut and Massachusetts stand foremost in their

attention to silk. In Connecticut, the effect of the exertions of some ardent friends of the cause, previous to the revolutionary war and just about the close of the last century, is still felt; and several establishments, especially in the town of Mansfield and vicinity, show what might have been done through the whole country had the same perseverance been manifested, in spite of early discouragements, and the same willingness to be contented with moderate profits. The experience of that little town warrants the belief that is expressed by some of its inhabitants that 'the time is not far distant when we, as a country, shall raise our own silk and manufacture it, and ultimately compete with foreign nations.' From Massachusetts we learn 'that the country has taken hold of it in earnest; each year, for some years, has doubled on the preceding. Last year (1842) 400 or 500 were engaged in that business in Massachusetts, and more than double that number in New England.' Several establishments for its manufacture are found in this state in successful operation. In parts of Vermont, there are also individuals who are devoting considerable attention to the production of silk; but, as the climate is so much colder here, and in Maine and New Hampshire, than in any other New England states, they are less favourably situated for the business. It is, however, increasing; and, among other things on this subject, it is stated that several thousand dollars' worth of the eggs of the silkworm have been sent to the West Indies. *There is a bounty given by the state government.*

"At the fair of the New York State Agricultural Society, the crop of nineteen persons in a single district of the country was 2150 lbs. In Monroe county, the quantity offered for the state bounty was said to be 2256 lbs.; the year before, it was 1695 lbs.; in 1841, 1539 lbs.

"There are two or three establishments for the manufacture of silk in New Jersey, and for some time there was formerly published a paper relating to this subject in this state.

"Pennsylvania formerly gave a bounty on the production of cocoons or silk; but the law has been repealed. This has excited some unfavourable influence, and probably prevented the progress of the crop as much in this large state, as would have been the case had the encouragement been continued. The following statement shows what has been the progress of the silk culture at '*Economy*,' in five years, commencing in 1838:—

Years.	No. of lbs. of cocoons.
1838	1,400
1839	1,800
1840	2,400
1841	4,400
1842	5,500
Total in five years	15,500

"The largest crop raised at one establishment in Europe, 200 years after the culture of silk was introduced, it is said was 3000 lbs.

"In Maryland are some ardent friends of this object; and though some have been unsuccessful in past years, in respect to the *multicaulis*, yet the belief is expressed that the silk business is yet destined to do well.

"For the southern states this business of silk culture is admirably adapted, and yet comparatively little has been done with regard to it there. On this subject we have the opinion of some residents in that part of the country. One of them writes thus: 'The great difficulty in all matters of improvement in the south is, it is too small a business—too much trouble, or too long to get the return. My own opinion is, that it is to us of the south the greatest business that has ever presented itself. An old negro, competent to feed young children or chickens, with the aid of a few small chaps from four to eight years of age, can make as much as grown hands can in the field, and this without any expense of gin-house and machinery.' 'It seems to me a business peculiarly appropriate for the south. We can commence feeding on the 20th of April (this year on the 16th, last year on the 24th). We can feed without taking our field hands, or any extra building; and what is done thus is entire gain.' In Georgia, we are informed to this effect:

'One family has made thirty yards of beautiful silk, and made it up into ladies' dresses, and it is not inferior to the best French or English in appearance.' One of the members of congress from this state also informs us that he has a suit of silk of the manufacture in South Carolina. An experiment is mentioned as commenced in Louisiana, at Baton Rouge, by a gentleman from France, which seems to promise success. The amount of silk cocoons the past year in Tennessee, is estimated by one concerned in the manufacture, at from 20,000 lbs. to 25,000 lbs. In 1840, it is said, there were raised in that state but 1237 lbs. A fine manufactory here, under the superintendence of an experienced silk weaver from London; is said to have produced splendid specimens of satin. It is also said that 100 hands could now be employed in manufacturing the quantity of cocoons produced; and the opinion is expressed that, 'ultimately, no other business will equal it.' Governor Jones, of that state, has been presented with a full suit of domestic silk, by the silk-growers there, in acknowledgment of his efficient services to the cause of American industry.

"In Kentucky we notice, in one of the journals, that 500 skeins of beautiful sewing silk have been manufactured in one family; and it is evident that the attention to it is greater than formerly.

"Ohio has one of the finest establishments in the country, which manufactures 1000 bushels of cocoons annually, with a capital of 10,000 dollars, and employing from forty to fifty hands. The amount of cocoons produced in the Ohio valley is estimated 'at least sufficient to keep 200 reels in operation.'

"Much attention, likewise, is paid to the silk business in Indiana; and the success experienced justifies the expectation that the culture of silk will hereafter become a great business there.

"In Michigan, Mississippi, and Wisconsin, also, by the accounts given, the attention is more directed to this crop than heretofore.

"The whole crop of 1842, is estimated at 315,965 lbs. of cocoons.

"The resolutions passed by the convention at New York on the subject, express the strongest confidence in the prospects of the silk culture."—*Report for 1843 and 1844.*

"The estimated crop of silk for 1844, is 396,790 lbs. of cocoons."

HEMP AND FLAX.

Our information relative to the cultivation of hemp and flax is confined nearly altogether to the official tables for 1840, and to Mr. Ellsworth's reports:—

"Hemp is beginning to be raised somewhat more in the northern and eastern states. This is true especially of the northern part of the state of New York. At present, however, it is confined to the seed crop, owing to the high price of the seed. It is affirmed to be a mistake to suppose that it must be confined to alluvial lands, as has been shown by the farmers of Saratoga and Washington counties, in the state of New York. When planted in drills, at a suitable distance, as it should be, and properly cultivated, hemp generally produces, it is said, from twenty to forty bushels of seed to the acre; and instances are not rare of its yielding from fifty to sixty bushels. The seed is generally worth from three to six dollars per bushel. When sown for the lint, it should be sown broadcast, from two to three bushels of seed to the acre, depending on the quality of the land; and it usually produces from 700 to 1000 weight of clean hemp to the acre."—*Report for 1841.*

"In the state of New York, the crop has advanced. This is partly owing to the fact that the farmers of Seneca, and some other counties, have been induced by the proprietors of two oil-mills to sow about 1000 acres of flax for the seed; the yield is said to be from ten to fifteen bushels per acre. The increase is thought to be as high as fifteen or twenty per cent. In New Jersey, the falling off of the flax crop was 'from fifty to seventy-five per cent,' and it is said to have been 'almost an entire failure.' In the other middle and southern states, generally, there was an advance on the crop of 1842, of from five to ten per cent.

"In Mississippi, the cultivation of hemp is said to be increasing. The product raised is about one-half a ton to the acre; whereas, in Kentucky, 800 lbs. is esteemed a good crop. One planter, who, in 1842, raised three acres, intended to put in fifteen acres for

1843. Still the crop for the past year is said to have been short, compared to what it might have been, had the season been more favourable. The hemp crop of Tennessee was, probably, a small increase above that of 1842, perhaps five per cent. Kentucky is considered foremost in its crop of hemp. The accounts respecting its production for the past year in this state represent it as in some parts a medium crop, selling for three dollars to four dollars per 100 lbs. In other sections, it is thought to have been not an average crop, and 'one-third less than in 1842,' principally owing to the heavy rains and hail-storms in the spring; the decrease from these causes is estimated to have been as much as fifteen per cent. In Ohio, the crop of flax and hemp is considered to have advanced ten per cent. From some parts, the information received placed it as high 'as twenty per cent;' while, in others, it was reckoned 'about the same as in 1842.' More is said to be raised for seed than for lint. In Indiana the accounts vary; the flax in the south-eastern part of the state is pronounced to have been 'a good crop;' while, on the western side of the state, near the Wabash, both flax and hemp failed. In the south-western section, it is thought to have been 'twenty per cent more,' and in the north-western, 'twenty-five per cent short, owing to the drought.' Not a great deal of either flax or hemp is grown in Illinois; in some parts, the crop was 'an average one;' 'a fair crop;' 'good.' In other sections of the state, however, the information is more unfavourable. Our informant says, 'Recently much attention has been bestowed on the raising of hemp. No part of the United States is superior to Illinois for this production. I was born and educated in the best hemp county in Kentucky, and I am satisfied the same number of hands can tend more hemp in Illinois, and prepare it for market, than in Kentucky. The hemp is now transported chiefly to St. Louis; but manufacturing establishments are now beginning in Illinois, which will consume a portion of what is raised in that state. Should a machine be found which will answer the purpose of breaking the hemp cheaper than it can be done by hand, Illinois will soon raise more hemp than any other state in the union.' The crop of hemp in Missouri, though not as large as might have been hoped for, has somewhat gained on the previous year. In a public journal, in September, we find the following notice:—'The hemp crops in this section of the state are proving to be much better than was anticipated some time since; many crops, since cutting, have been found to be nearly, if not quite, as good as they were last year. The crops in the prairies are, to some extent, a failure; but, in the rich timbered lands, they may be considered good.' In some parts of Michigan, there was more flax sown than before—even double that of last year—and the crop was good; but in others it fell short, owing to the dry cold weather in June; probably there was, on an average, a small increase. In Wisconsin, it was an average crop; while, in Iowa, it is said to have been uncommonly good, and has been estimated at an increase of twenty-five per cent, which seems too high; the whole average may have been ten per cent.

"A species of flax is mentioned as growing in the territory of Oregon, which is described as resembling the common flax in every thing, except that it is perennial. The natives are said to use it in making fishing-nets. The roots are too large, and run too deep, to be pulled like the common flax, but fields of it might be mowed like grass; and, if found to succeed, it might be raised without continual cultivation. Perhaps it may be worthy a trial to introduce it among us.

"A variety of hemp, also, which is indigenous, called the Indian hemp, is described in a scientific journal in 1826. It is said to grow profusely on our low lands. Its blossoms, like those of the silk weed, are purple, and the pods contain a quantity of silk, though less than the silk weed; but the coat of its stem is far superior in strength to the hemp. The gentleman who communicated an account of it to the New York Society for the Promotion of Useful Arts, in 1810, observes:—'I caused to be water-rotted a considerable quantity in 1804, and obtained an excellent hemp, as white as snow, remarkable for its strength, which proved to be double that of common hemp. I have been informed, that the Indians who formerly inhabited the land where my plantation is situated, on the east bank of the Hudson river, made great use of this plant; and, not many years ago, were still in the habit of coming from the distant place, where they now dwell, to collect it. Several of my oldest neighbours have assured me that the ropes and yarn which they made from the fibres of that plant, were far superior, for strength and durability, to those made of flax and hemp.'

"The plant, being perennial, could be cultivated and multiplied to the greatest advantage; and, being more natural to low and overflowed lands, could render productive certain pieces of ground which are now wholly unprofitable. It is further said to grow common in every section of the United States—'along water-courses, ditches, and borders of cultivated fields, flourishing best where agricultural operations have disturbed the soil;' and to grow 'from two feet to six feet high, the stem straight and bare, of a greenish red;' and the writer who mentions it in a western agricultural journal, says, also, 'I have never seen it grow with such luxuriance in any region as on our bottom prairies.'

"Bologna hemp is cultivated to a considerable extent in Kentucky. It is more easily broken than common hemp, is of a white colour, finer, and stronger. The trials which have been made of American hemp, as compared with Russian hemp, are said to have resulted very favourably for that raised in this country. The great difficulty experienced, still, is in a suitable process of water-rotting, to render it adapted to the purpose of the manufacturer.

"The Louisville Journal states, that 14,000 tons of hemp were produced in Kentucky the past year. From this it required 8500 tons to supply her factories, which manufactured 6,500,000 yards of bagging, and 7,000,000 lbs. of bale rope, sufficient to rope and cover 1,100,000 bales of cotton. This leaves Kentucky 5500 tons of hemp for exportation, which, if properly rotted, would bring 190 dollars to 200 dollars per ton.

"The number of square yards of canvass for our navy is calculated at 369,431. All this is now said to be made of American materials, but the cordage is still made principally from Russian hemp.

"Estimated crop of hemp, in the United States, for 1844, is 22,800 tons.

"Flax was once an article of considerable export, and now may be again raised profitably for the seed. In the year 1770, the quantity of seed exported amounted to 312,000 bushels. For twenty-two years previous to 1816, the average annual export was about 250,000 bushels. The reason why less attention is paid to the culture of flax now is, that it is so exhausting a crop. By a rotation of crops, however, this difficulty, it is presumed, might be in a great measure avoided. The smooth rich prairies of the west afford an excellent opportunity for raising flax to any extent; and, since linseed is an article which bears exportation so well, many thousand acres might be cultivated to advantage, especially as the crop may be either pulled by machinery, or, if seed is the only object, it may be cut with like facility."—*Reports for 1842 and 1844.*

"Mr. Parker, in his narrative of his journey across the Rocky Mountains, from the Mississippi to the Pacific, says, 'Flax is a spontaneous production of this country. In every thing, except that it is perennial, it resembles the flax that is cultivated in the United States—the stalk, the bowl, the seed, the blue flower, closed in the day time and open in the evening and morning. The Indians use it in making fishing-nets. Fields of this flax might be managed by the husbandman in the same manner as meadows for hay. It would need to be mowed like grass; for the roots are too large, and run too deep in the earth, to be pulled as ours are; and an advantage that this would have is, that there would be a saving of ploughing and sowing.' This was on a branch of Lewis or Snake river, of the Columbia.

"In a late journal of a passage across these mountains by Mr. Oakley, of Illinois, under date of the 21st of July, 1839, occurs the following: 'Encamped to-night in a beautiful valley, called Bayou Selard, twenty-eight miles from the head of the south fork of the Platte. It is a level prairie, thirty miles long and three wide, and was covered with a thick growth of flax, which every year springs up spontaneously.'"

CHAPTER VII.

FISHERIES OF BRITISH AMERICA.

THE fisheries of North America have long been eminently important, in regard to the maritime power of the United Kingdom, and of some other nations, as well as to trade and navigation.

The *great bank of Newfoundland*, which has been so long, and so famously resorted to by the English, Biscayans, and French, for the fishing of cod, is the most extensive sub-marine elevation yet discovered. Various theories and conjectures have been hazarded in order to account for its formation; some believe it was formerly an immense island, which had sunk in consequence of its pillars, or foundation, having been loosened by an earthquake. Others, that it has been created by the gradual accumulation of sand, carried along by the gulf stream, and arrested and lodged, on meeting with the currents of the north. It is, in some places, five degrees, or about 200 miles broad, and about 600 miles in length. The soundings on it are from twenty-five to ninety-five fathoms. The whole appears to be a mass of solid rock, formed like the other great inequalities of the globe. Its edges are abrupt, and deepen suddenly from twenty-five to ninety-five fathoms. In one place, laid down as rough fishing-ground, the soundings are only from ten to twenty fathoms. The Cape race, or Virgin rocks, near the inner edge of this bank, have lately been surveyed by one of her majesty's ships, and their position laid down correctly. These have always been considered dangerous, though seldom seen; and, although there is about four fathoms on the shoalest, yet, during a heavy sea, it is probable that a ship would be immediately dashed to pieces on them.

The best fishing-grounds on this bank, are between the latitudes of 42 deg. and 46 deg. north. The outer bank, or Flemish cap, appears to be a continuation of the grand bank, at a lower elevation. The soundings between them for about 100 miles, are from 120 to 218 fathoms.

The outer bank lies within the longitudes of 44 deg. 15 min., and 45 deg. 25 min. west; and the latitudes of 44 deg. 10 min., and 47 deg. 30 min. north. The soundings on it are from 100 to 160 fathoms. From the great bank to Nova Scotia, a continuation of banks succeed.

Fishes of various kinds are caught on all the American shores, lakes, and rivers, for the consumption of the inhabitants; but we shall confine our statements to the fisheries, and the fishing-grounds, which afford useful sources of employment to ships, boats, seamen, fishermen, and on shore to curers.

The cod fishery on the banks of Newfoundland, and along the coasts of North America, commenced a few years after its discovery. In 1517, mention is made of the first English ship which had been at Newfoundland; where, at the same

time, fifty Spanish, French, and Portuguese ships were fishing. The French, in 1536, were extensively engaged in this fishery; and we find that in 1578, there were employed in it; by Spain, 100 ships, by Portugal, fifty ships, and by England, only fifteen ships.* The cause of the English having, at this period, so few ships in this branch of trade, was the fishery carried on by them at Iceland. The English ships, however, from this period, were considered the largest and best vessels, and soon became, and continued to be, the admirals. The Biscayans had, about the same time, from twenty to thirty vessels in the whale fishery at Newfoundland; and some English ships, in 1593, made a voyage in quest of whales and morses (walrus), to Cape Breton, where they found the wreck of a Biscay ship, and 800 whale fins. England had, in 1615, at Newfoundland, 250 ships, and the French, Biscayans, and Portuguese, 400 ships.†

From this period the fisheries carried on by England became of great national consideration. De Witt observes, "that the English navy became formidable by the discovery of the inexpressibly rich fishing bank of Newfoundland." In 1626, the French possessed themselves of, and settled at, Placentia; and that nation always viewed the English at that fishery with the greatest jealousy; but still the value of those fisheries to England was fully appreciated, as appears by the various acts of parliament passed, as well as different regulations adopted for their protection.‡ Ships of war were sent out to convoy the fishing vessels, and to protect them on the coast; and many of the ships engaged in the Newfoundland fisheries, as far back as 1676, carried about twenty guns, eighteen small boats, and from ninety to 100 men.

By the treaty of Utrecht, the value and importance of our fisheries at Newfoundland, Nova Scotia, and New England are particularly regarded. The French, however, continued afterwards, and until they were deprived of all their possessions in North America, to carry on more extensively than the English did, the fisheries on the banks and coasts of America; and in 1734, heavy complaints were made by the English, who had established a very extensive and profitable fishery at Canso, in Nova Scotia, against the French at Louisburg, and other places in the neighbourhood.

About this period, the inhabitants of New England had about 1200 tons of shipping employed in the whale fishery; and with their vessels engaged in the cod fishery, they caught upwards of 23,000 quintals of fish, valued at 12s. per quintal, which they exported to Spain, and different ports within the Mediterranean, and remitted the proceeds in payment for English manufactures, 172,000l.§

The value of this fishery, and the important ship fishery carried on by the English at Newfoundland, were, however, of less magnitude than the French fisheries before the conquest of Cape Breton. By these alone, the navy of

§ Anderson on Commerce.

France became formidable to all Europe. In 1745, when Louisburg was taken by the forces sent from New England, under Sir William Pepperell and a British squadron, the value of one year's fishing in the North American seas, and which depended on France possessing Cape Breton, was stated at 982,000*l*.^{*} It is, however, probable that both the English and French accounts of the American and other fisheries were exaggerated; those of Holland certainly were, not only by Sir Walter Raleigh, but also by De Witt.

It was a maxim with the French government, that their American fisheries were of more national value, in regard to navigation and power, than the gold mines of Mexico could have been, if the latter were possessed by France.

In 1748, however, at the treaty of peace, England restored Cape Breton in return for Madras, which the forces of France had conquered two years before; and that nation again enjoyed the full advantages of the fisheries until 1759, when the surrender of Cape Breton, St. John's, and Canada, destroyed French power in North America.

By the third and fourth articles of the treaty of Fontainebleau, signed in 1762, it was agreed, "that the French shall have the liberty of fishing and drying on a part of the coasts of the island of Newfoundland, as specified in the thirteenth article of the treaty of Utrecht; and the French may also fish in the Gulf of St. Lawrence, so that they do not exercise the same but at the distance of three leagues from all the coasts belonging to Great Britain, as well those of the continent as those of the islands in the said gulf. And as to what relates to the fishery out of the said gulf, the French shall exercise the same but at the distance of fifteen leagues from the coast of Cape Breton. Great Britain cedes to France, to serve as a shelter for the French fishermen, the islands of St. Pierre and Miquelon; and his most Christian Majesty obliges himself, on his royal word, not to fortify the said islands, nor to erect any other buildings thereon, but merely for the convenience of the fishery; and to keep no more than fifty men for their police."

In the history of the fishery, little of importance appears from this period until the commencement of the war with America, France, and Spain, which interrupted and checked the enterprise of the fishing adventurers.

The peace of 1783 gave the French the same advantages as they enjoyed by the treaty of Fontainebleau; and the right of fishing on all the British coasts of America, was allowed to the subjects of the United States, in common with those of Great Britain. In restoring to France the islands of St. Pierre and Miquelon, it was contended that they were incapable of being fortified; while it is well known that both these islands are, in an eminent degree, not only capable of being made impregnable, but that their situation commands also the entrance to the Gulf of St. Lawrence.

The following ships appear to have been exclusively employed in the Gulf

^{*} Sir William Pepperell's Journal.

fishery. In 1578, fifteen; in 1615, 150; in 1622, 170; in 1626, 150; in 1670, 102; employing 1980 men; and the value of the fish, oil, &c., taken, is stated to be 386,400*l*. In 1731, the catch of fish was equal to 200,000 quintals. The following shows the progress of succeeding years :—

After the American revolutionary war, the fisheries of British America were prosecuted in Newfoundland with energy and perseverance.

In Nova Scotia and New Brunswick, the herring, mackarel, and gaspereau fisheries, were followed, but only on a limited scale. At Percé and Paspabiac, in the district of Gaspé, the cod fishery was carried on with spirit by two or three houses; and the salmon fishery followed at Rustigouche and at Miramichi. The cod fishery at Arichat, on the island of Madame, was pursued by the Acadian French settled there, who were supplied with provisions, salt and naval stores, by hardy and economical adventurers from Jersey. The valuable fisheries on the coasts of Nova Scotia, New Brunswick, and Prince Edward island, were, however, in a great measure overlooked or disregarded.

The last war with France drove the French again from the islands of St. Pierre and Miquelon, and from the fisheries. At the peace of Amiens, they returned again to these islands; but were scarcely established before the war was renewed, and their vessels and property seized by some of our ships on the Halifax station. This was loudly remonstrated against by the French government.

A combination of events occurred during the late war, which raised the fisheries, particularly those of Newfoundland, to an extraordinary height of prosperity.*

* In 1814, the exports were :—

1,200,000 quintals of fish, at 2 <i>l</i> . per quintal	£2,400,000
20,000 ditto of pickled codfish, at 12 <i>s</i> . ditto	12,000
6,000 tuns of cod oil, at 32 <i>l</i> . per tun.....	192,000
156,000 seal skins, at 5 <i>s</i> . per skin	39,000
4,666 tuns of seal oil, at 36 <i>l</i> . per tun.....	167,976
2,000 tierces of salmon, at 5 <i>l</i> . per tierce	10,000
1,685 barrels of mackarel, at 1 <i>l</i> . 10 <i>s</i> . per barrel	2,527
4,000 casks of caplin, sounds, and tongues	2,000
2,100 barrels of herrings, at 1 <i>l</i> . 5 <i>s</i> . per barrel	2,625
Beavers and other furs	600
Pine timber and planks.....	800
400 puncheons of berries	2,000

Total..... 2,831,528

Great Britain possessed, almost exclusively, the fisheries on the banks and shores of Newfoundland, Labrador, Nova Scotia, New Brunswick, and the Gulf of St. Lawrence. England enjoyed a monopoly of supplying Spain, Portugal, Madeira, different parts of the Mediterranean coasts, the West Indies, and South America, with fish; and British ships not only engrossed the profits of carrying this article of commerce to market, but secured the freights of the commodities which the different countries they went to exported. By such eminent advantages, the fishery flourished, and great gains were realised both by the merchants and ship-owners. But these individual gains were realized during a war expensive beyond precedent to the nation.

It is very remarkable that, in our treaties with France, the fisheries of North America were made a stipulation of extraordinary importance. The ministers of that power considered the value of those fisheries, not so much in a commercial view, but as essential in providing their navy with that physical strength which would enable them to cope with other nations.

The policy of the French from their first planting colonies in America, insists particularly on training seamen by means of the fisheries. In conducting their cod-fishery one-third, or at least one-fourth, of the men employed in it were "green men," or men who were never before at sea; and by this trade they bred up from 4000 to 6000 seamen annually.

Kinds of Fish most important.—The descriptions of fish that swarm round the shores, and in the bays and rivers, or that abound on the different banks on the coasts of North America, are very numerous. The following are those most commonly known:—hump-back whale, and two or three other kinds; porpoise, horse-mackarel, shark, dog-fish, sturgeon, cod, eel, haddock, ling, hake, salmon, herring, allwife, mackarel, bass, shad, pond-perch, sea-perch, sculpion, trout, scale-fish, tom-cod, halibut, flounder, smelt, caplin, and cuttle-fish or squid. The quality of the different varieties of fish may be considered nearly similar to that of the same species caught in the British seas. Some, however, think that the cod, spring-herring, and haddock are, when fresh, inferior to those in the English markets. The herring caught in spring, at which time they enter the bays to spawn, are certainly not so fat; but those taken in autumn are equally as fine. The mackarel is a very delicious fish, and of much finer flavour than those caught on the shores of Europe.

In describing the fishes that abound along the coasts of our American possessions, the tribes that are of the most importance to us, as affording food, and the means of employment to man, claim the greatest attention; and nature has, in the seas of those regions so bountifully provided for the necessities of man, as to create the tribes of fishes most useful to us, in the most abundant multitude.

The *herring* and *cod* are the most generally plentiful. The first, on which the

latter feeds, precedes it, arriving in the latter days of April or early in May, and attracts it to the shores of those countries. Then follow myriads of caplin (*salmo arcticus*), always accompanied by vast shoals of cod, which are again kept on the coasts by the multitudes of cuttle-fish (*sepia loligo*), called squid in America, which the domains of the ocean send forth. *Allwives* and *mackarel* appear periodically on the coasts, all undoubtedly governed by imperative natural laws, or what we generally explain as animal instinct.

Herrings come down in shoals from the north, and striking in upon the coasts, gulfs, and bays, appear during summer as far south as Carolina. The dog fish is one of the most voracious of the herring destroyers. The *porpoise* and various other sea monsters also follow and devour herrings.

Of the *cod*, which ranks first in commercial importance, there appears to be four kinds, although their history has not been sufficiently attended to in order to determine their relations to each other as species or varieties.

The *bank cod* (*gadus bancus*) frequents the great bank of Newfoundland and other banks at a great distance from land. It differs from the other species in its not approaching the shores, its living principally on shell-fish, its body being larger and stronger, its colour lighter, its scales and spots larger, and its flesh firmer. It resembles and is probably the same kind as the *Dogger bank cod*, brought to the London market.

The *shore cod* is nearly of the colour of the bank cod, and approaches the shores, and enters the harbours, following the smaller fish, on which it feeds. It resembles most the cod on the coasts of Britain, and it is of this kind that the greatest quantity is taken, at least during late years.

The *rock, or red cod* (*gadus calcurias*) resembles, but is generally somewhat larger than, the rock cod, or red ware codling of the Scotch coast.

The *seal-head cod*, called so from its head resembling that of a seal, is the most remarkable and the most rare kind. Other differences are observed in the cod, which may arise from the peculiarity of the coasts they frequent. The livers of the cod farther north, are smaller, and less oil is obtained from the bank cod, than from any of the other varieties. It has been calculated that upwards of 400,000,000 of cod are caught annually on the coasts of British America.

The migrations of the cod are governed by the movement of the fishes on which they feed. The herring appears along the shores and in the harbours in vast swarms, or, as they are termed, shoals, early in May, for the purpose of spawning; and they may often be discovered from the whitish colour of the water over them, which is also at times quite smooth, although blowing hard, in consequence of the oily particles thrown off with the spawn.

The cod follows the herring, and remains close to the shores for some time, and then retires two or more miles. On the coast of Newfoundland in June, and

on that of Labrador in July, the caplin brings vast swarms of cod; and in August the cuttle-fish appears, followed by its voracious enemy.

On the banks, and within the Gulf of St. Lawrence, shell-fish of various kinds are the principal food of the cod. The *haddock* (*gadus aglefinus*) is much larger than on the coast of Europe, but inferior in quality. It is frequently caught among the common cod; but seldom when the "catch" is abundant.

Herrings appear again on the coasts of America in summer and autumn, and are very fat; those caught in spring are larger, but very poor.

Allwives, or *gaspereau*, appear on the coast immediately after the herring, within the harbours of the Gulf of St. Lawrence, and on the coasts of Nova Scotia, New Brunswick, and the New England States, but never we believe at Newfoundland, or farther north. The *gaspereau* somewhat resembles the herring, or is rather in appearance, a small species of shad. The scales are stronger and larger than those of the herring, and on the belly there is a sharp scaly ridge; when fresh, this fish is rather fat, and tolerably good eating; but when salted, it becomes thin, and much inferior to herring. It answers the West India market well, to which it forms an article of export of some importance.

In April, *smelts* ascend the brooks and rivulets from the sea in vast numbers to spawn. On first arriving this delicate fish is excellent; but it soon becomes poor in fresh water. It remains in the harbour all winter, and is caught with a hook and line through the ice.

Mackarel arrive on the coast in the summer, but they are then poor. Those caught in autumn are very fat. Vast quantities are caught with seines and nets; they are also caught with a hook and line, trailing fifteen or twenty fathoms after a boat or vessel under sail.

Mackarel frequent the seas of the northern temperate zone; herrings appear first in the north, and proceed south; *mackarel* appear on the coasts of America from the south, and then swim to the north. They increase in size, plumpness, and delicacy, as they proceed north. They seldom exceed two pounds in weight. The male, or milter, is generally preferred, but the roes of the female are esteemed for *caviare*. To examine, and indeed to eat the fish, it must be newly taken; keeping a few hours renders it comparatively flabby and insipid; in salting or pickling, therefore, the processes should be commenced as soon as possible after they are caught. They are voracious, and dart at a bit of scarlet cloth, or any brilliant, or silvery bait. They follow, or rather meet, and devour herrings. In the spring, *mackarel* are nearly blind, in consequence of a film that grows over their eyes, but which wears off towards summer.

The *caplin* (*salmo arcticus*) is about six or seven inches long, and resembles a smelt in form and colour, but it has very small scales. It is delicate eating, but its chief value is as bait for cod. The masses of this fish which frequent the shores of Newfoundland and Labrador would appear incredible, were not the fact

witnessed by thousands for many years. Dense shoals of them are sometimes known to be more than fifty miles in length, and several miles broad, when they strike in upon the coast and push into the creeks and harbours. Their spawn is frequently thrown upon the beach in great quantities, which a succeeding tide or two generally carries back to the sea.

The *cuttle-fish* (*sepia*) is from six to ten inches long, molluscous, and its shape and organisation peculiar. It is generally caught with jiggers; but hundreds of tons of this fish are thrown up on the flat beaches, and the decomposition which follows produces the most intolerable effluvia. Newfoundland is also the principal resort of the cuttle-fish. It sometimes appears at Nova Scotia, Cape Breton, and occasionally at Prince Edward Island.

Salmon resort to the harbours and rivers of Labrador in great plenty, and are often abundant in many of the rivers of Newfoundland, all the rivers within the Gulf of St. Lawrence, and those of New Brunswick, Nova Scotia, and Maine are also frequented by salmon. Salmon seem to appear on the coast of America farther south than the Hudson. They are generally larger than those that appear in the English market, and are remarkably fine when in season. But, according to the statements of travellers, there are no rivers in the world which abound in larger or better salmon than those of the Oregon territory.

Shell-fish—The varieties of shell-fish are oysters, clams, muscles, razor shell-fish, wilkes, lobsters, crabs, shrimps, &c., and equally delicious as those taken on the English, Scotch, Irish, or Norwegian shores.

There are two or three varieties of *oysters*, the largest of which is from six to twelve inches long, and as fine flavoured as those taken on the British coasts.

Eels.—Epicures consider the eels of the most delicious kind. During summer and autumn, the Indians spear them in calm nights by torch-light. The torches are made of the outer rind of the birch-tree, fixed within a slit made to receive the same, in the end of a stick about four or five feet long. When lighted, it is placed in the prow of the bark canoe of the Indian, near which he stands, with a foot on each gunwale, and in a situation so ticklish, as to require the tact of a master to preserve his balance, which he does, however, with apparent ease. A boy, or sometimes his squaw (wife), paddles the canoe slowly along, while with a spear, the handle of which is from fifteen to twenty feet long, he is so dexterous and sharp-sighted, that he never misses the fish at which he darts it. Salmon, trout, and various other fishes, are taken in the same manner.

During winter, eels live under the mud, within the bays and rivers, in places where a long marine grass (called eel-grass) grows, the roots of which, penetrating several inches down through the mud, constitute their food. At this season they are taken in the following manner:—a round hole, about two feet in diameter, is cut through the ice over ground in which they are usually known to take up their winter quarters. The fishermen, with a five-pronged spear, attached to a handle

from twenty-five to thirty feet long, then commences, by probing the mud immediately under the hole; and by going round and round in this manner, extending on one circle of ground after another, as far as the length of the spear-handle will allow, comes in contact with the eels that lie underneath, and brings them up on the ice. Sometimes in the early part of winter we may see from fifty to sixty persons on one part of the ice fishing eels in this way. Trout, smelt, tom-cod, and perch, are caught in winter with hook and line through a hole in the ice; within the Bras d'or waters of Cape Breton, fine cod-fish are taken during winter in the same manner.

The walrus.—The walrus (frequently, but unmeaningly, called sea-horse and sea-cow) formerly resorted to the shores of the Gulf of St. Lawrence, but is now rarely seen except on the northern coast of Labrador and Hudson Bay, and occasionally at the Magdalen Islands, and near the Straits of Belle Isle.

Seals.—There are, apparently, five or six varieties of seals that frequent the coasts of America; but, with the exception of the harbour seal (*phoca vitulina*), which does not seem to be migratory, it is probable that age and accident produce the difference in size, shape, and colour, that has occasioned their being classed in varieties, as they come down promiscuously on the ice from the hyperborean regions in immense herds. They leave the polar seas with the ice, on which they appear to bring forth their young. On the ice dissolving they return again to the north. Five kinds are named in the Greenland seas, and these come down to the coasts of Labrador, Newfoundland, and the Gulf of St. Lawrence. The harp seal (*phoca Groenlandica*); the hooded seal (*phoca leonina*), and three other varieties, the square flipper, the blue seal, and the jar seal.

Herds of these, many leagues in extent, on the ice, seem to have no means of subsistence. Caplin and other substances are, it is true, occasionally found in their stomachs; but from the impossibility of their being able, often for a week, to get off the ice into the water, it is wonderful that both old and young are exceedingly fat. The flesh is very unpalatable. Many of these seals are beautifully speckled, black and white, others gray, and some blue.

Seal Fishery.—The vessels equipped for the seal fishery are from 60 to 120 tons each, with crews of from sixteen to thirty men. They are always prepared for sea, with necessary stores, fire-arms, poles to defend them from the ice, &c., before the feast of St. Patrick. Immediately after, the crews at the harbours, then frozen over, collect together, with all assistance from the shoremen, and dividing themselves into two rows on the ice, and provided with hatchets, large saws, and strong poles, fix on two lines far enough separate to allow their largest schooners to pass. Each party cuts along its respective line, and they divide the solid mass between them into squares, which are shoved with poles under the firm ice; continuing this laborious operation until a channel is open to the sea. The vessels then proceed to the field-ice, pushing their way through the openings, or

working to windward of it, until they meet it covered with vast herds of seals. Where these occur, the part on which they are is called seal meadows. These animals are surprised by the seal hunters while they are sleeping on the ice, and attacked with firelocks or with strong bludgeons, which are considered preferable. But the hunters have frequently to shoot the large ones, which will turn upon the men and make resistance. The piteous moan and cry of the young ones during the slaughter, require more than common nerves to disregard. The hooded seals will draw their hoods, which are shot-proof, over their heads.

The skins, with the fat surrounding the bodies, are stripped off together, and the scalped carcasses left on the ice. The pelts or scalps, are carried to the vessels, and packed closely in the hold ; but the weather often is such as to leave no time to scalp the seals on the ice, and the carcasses are then carried whole to the vessels.

The situation of these vessels, during the storms of snow and sleet, which they have at that season inevitably to encounter, is attended with fearful dangers. Many vessels have been crushed to pieces by the tremendous power of the ice closing on them, and their crews have also not unfrequently perished. Storms during night, among the ice, must be truly terrible ; yet the hardy Newfoundland seal hunters seem even to court those sublime and hazardous adventures.

When the vessels are loaded with scalps, or if unsuccessful, when the ice is scattered, and all, except the islands, is dissolved by the heat of the advancing summer, they return to their respective ports. Some vessels, which succeed soon after meeting the ice in filling up a cargo, make a second voyage.

The fat, or seal-blubber, is separated from the skins, cut into pieces, and put into framework vats, through which, and small boughs inside, the oil oozes on being exposed to the heat of the sun. In three or four weeks it runs rapidly off, and becomes the seal oil of commerce.

The vats for cod-oil are made of strong planks dovetailed at the ends, and strengthened with iron clamps. Whatever water is mixed with the cod-blubber, is afterwards allowed to run out by a plug-hole at the bottom, while the oil, floating on the top, runs off at different holes, and is guided into casks by leather spouts. The first that runs off is the virgin, or pale oil, and the last the brown oil. The blubber fritters are afterwards boiled in a metal cauldron to obtain the remaining oil from them.

The planters sell their seal pelts to the merchants who manufacture the oil and ship it off in hogsheads, principally to England.*

The seal-skins are spread and salted in bulk, and afterwards packed up in bundles of five each for shipping.

Seals are still caught at Newfoundland and Labrador,* on the plan first

* The water pumped out of vessels carrying oil always calms the surrounding sea ; and the sea on the banks was made smooth, it is said, during the fishing season when the bank fishery predominated.

adopted, by strong nets set across such narrow channels as they are in the habit of passing through.

Cod Fishery.—In the beginning of June, the cod-fishery commences. The bank fishing is now, from various causes, abandoned by the English to the Americans and French, although the political value of Newfoundland as a nursery for seamen depended very much upon this fishery. It was carried on by vessels, fitted out in England; and the people employed in it being the greater part of the year at sea, exposed to the weather of all seasons, cold and hot, stormy and calm, wet and dry, were consequently prepared for any hardship, and ready to encounter any danger.

The bankers, or vessels fishing on the banks, usually anchor where they find plenty of cod, which they catch with lines and hooks, or occasionally with jiggers. The operation of gutting and splitting are the same as on shore; and the fish is salted in bulk in the vessel's hold, until the cargo is completed. The fish caught on the banks are larger than those caught by the boats employed in the shore fishery, but do not look so well when cured, owing to lying so long in salt before being dried. It is, however, preferred in some markets on account of its size. At present, there are but few British vessels employed in the bank-fishery; formerly there were 600 or 700.

The boats used for the shore-fishery are of different sizes, some requiring only two hands, whilst others have four, which is the general number. It is not uncommon to observe boys and girls, when cod is plentiful, fishing in these boats. Every fisherman is provided with two lines, having to each two hooks; both lines are thrown over at the same time, one on each side of the boat, to which one man attends. The kind of bait in season used, is such as herring, mackarel, caplins, squid, and clams, and when none of these are to be had, the flesh of animals. The entrails of fish taken with jiggers, and what is found within them, is also used for bait. A jigger is a piece of lead made into the form of a small fish, with two hooks fixed in its mouth, and turned outwards in opposite directions. It is made fast to a line, and thrown over into the sea; and by jerking it up and down the hooks frequently fasten into the cod or other fish; the cod, which is probably the most voracious fish we know, also darts at and swallows the artificial fish with the hooks fastened in it; by these methods vast quantities of cod are caught. Seines are also used, by which multitudes of cod are hauled ashore in coves on the coast of Labrador.

When the boats are stationed on the fishing ground, which is sometimes within the harbours, and in the first of the season, near the shore, the men sit or stand at equal distances from the gunwales, and each attends to his own lines. So abundant are the fish at times, that a couple of cod are hooked on each line before the lead reaches the bottom, and while the one line is running out the fisherman has only to turn round and pull in the other, with a fish on each hook.

In this way they fill the boat in a very short time. If the cod be very large, it is lifted into the boat as soon as it comes to the water's edge, by a strong iron hook fixed on the end of a short pole, called a gaft. As soon as the boat is loaded, they proceed to the stage on the shore with the fish, when the operations of splitting and salting succeed. Fish should be brought to the shore within forty-eight hours, at farthest, after it is caught. When plentiful, the boats often return in two or three hours, and push away again immediately after the fish is thrown on the stage.

The stage is a building erected on posts, jutting out into the sea, far enough to allow the fishing boats to come close to its end. Generally covered over, and attached to it, or rather on the same platform, is the salt-house, in which there are one or more tables, with strong wooden stools for four important personages among the shoremen, distinguished by the expressive cognomens of cut-throat, header, splitter, and salter. The splitter is next in rank to the foreman of the fishing-rooms, who is called master-voyage, and, under him, receives most wages; the next in precedence and wages is the salter. The cut-throat and header are pretty much on a par.

The fish is thrown, with a kind of pike, upon the stage, and carried, generally by boys or women, to the long table. The business of the cut-throat, as his name implies, is to cut, with a sharp-pointed, double-edged knife, across the throat of the fish to the bone, and rip open its bowels. He then passes it quickly to the header, who, with a strong, sudden wrench, pulls off the head, and tears out the entrails, passing the fish instantaneously to the splitter, and, at the same moment, separating the liver, precipitates the head and entrails through a hole in the platform, into the sea, under the stage-floor. The splitter, with one cut, lays the fish open from head to tail, and, almost in the twinkling of an eye, with another cut takes out the sound-bone, which, if the sounds are not to be preserved, he lets fall through a hole into the sea, throwing the fish, at the same moment, with the other hand, into the trudge-barrow. Such is the amazing quickness of the operations of heading and splitting, that it is not unusual to decapitate and take out the entrails and back-bones of six fish in one minute.

When the barrow is full, it is carried away immediately to the salter, and replaced by another.

The business of the salter is most important, as the value of the whole voyage depends on his care and judgment. He takes the fish out of the barrow, one by one, spreads them, with the back undermost, in layers, sprinkling a proper quantity of salt between each. The proportion of salt necessary to cure codfish is generally estimated at the rate of one hogshead to ten or twelve quintals; but much depends on the place, and the state of the weather. More salt is used for green fish, or fish remaining long in bulk, than for fish salted on shore to be spread out to dry in a few days; and more is necessary at Labrador than at Newfoundland. Sometimes the fish is salted in vats, which requires less salt, and

also increases the weight ; but it does not look so well, nor is it so much esteemed in foreign markets.*

In salting, the *bulks* must not be high, as the weight of the higher would injure the lower tiers. In bulks, the fish must remain five or six days, and in vats four or five. It is then carried in barrows, and thrown into vats or troughs full of holes, suspended from the stage in the sea. In this vat, the washer stands up to his knees among the fish and sea water, and wipes off the salt with a mop. The fish is then carried away in a barrow, and piled in a long heap, called by the unintelligible name of "water-horse," for the purpose of draining. In this state it may remain a day, before it is spread out on the flakes.

The fish then undergoes the process of drying. They are spread, heads and tails, either on hand-flakes, which are about breast high from the ground, and slightly constructed, or on broad flakes, raised on strong posts, sometimes twenty feet high, with platforms of poles laid across. The latter, as being more exposed to pure air, are considered preferable. The fish is also, at times, spread out on boughs laid on the beach or ground. In the morning, it is usually spread, with the fleshy side uppermost, and turned about mid-day, or more frequently if the weather be hot. In the evening, they are gathered into small heaps, called "fagots," which are increased in size, as the fish dries, from four or five to twenty, or more ; and, when nearly cured, made into large circular piles, much in the form of a haystack, with the upper layers always laid down, with the skin uppermost. These piles are thatched with rinds of the spruce fir, or with tarpaulins, or circular deal frames, which are pressed down with heavy stones. After remaining some time on these piles, to "sweat," as the fishermen term it, the fish is spread out again to complete the drying, and then removed into the warehouses.

As the least rain will spoil the fish, if not immediately attended to, nothing can exceed the hurry of men, women, and children, whenever showers come on ; they abandon every other engagement, and even run, if on Sunday, out of places of worship to collect the fish into fagots or piles.

The nature of the cod-fishery is truly precarious. Sometimes the cod is not equally abundant on all parts of the coast, and, in that case, the fishermen have often to go a great distance in quest of them, and, in some cases, have to split and salt their fish in the boat. The incessant labour, also, which attends the curing, leaves the shoremen scarcely time, during the season, to eat their meals, and allows them little more than four hours' sleep.

The quality of the fish is affected by the least inattention or error in curing. If the weather be hot and calm, it is affected with fly-blows, and becomes maggoty ; and a few fish of this description may contaminate a whole cargo. If too much salt have been used, the fibres break in drying, and the fish falls to pieces. In this state, it is called salt-burnt, and is unfit for market. It is

affected much in the same way when left too long exposed to the sun, without turning, and is then called sun-burnt. In damp or wet weather, putrefaction is apt to commence; it then becomes slimy; or, by the weather beating on it, when in piles, it sometimes takes a brownish colour, and is called dun-fish which, although excellent for present use, is not fit for shipping.

Previous to exportation, the fish is again spread out to dry, when it is *culled*, or sorted, into four qualities. First, the merchantable, which are those of the finest colour and quality; second, Madeira, which are nearly equal to the first; third, West India fish, the refuse of all that is sufficiently cured to stand a sea-voyage without putrifying, and which, with the greater part of the Madeira, is sent for sale to the West Indies, to feed the negroes; lastly, the broken fish, dun-fish, or whatever will not keep in warm countries, but which is in general equally good for domestic consumption: mud-fish, or green-fish, is generally understood to be codfish either wholly or partially split and pickled. The sounds are generally taken from the bones, and the tongues cut out of the heads by women and children, or old men. They are pickled in kegs. The livers of cod are put into vats or puncheons, exposed to the sun, the heat of which is sufficient to render them into oil, which is drained off, and put into casks for shipping, the remaining blubber is boiled to obtain the oil it contains.

The livers taken from the number of cod that will, when dry, make up 300 quintals, ought to produce a tun of oil; but sometimes it requires double the quantity to yield a tun, while the livers of 150 quintals have been known to produce a tun.

The shore-fishery is the most productive of both merchantable fish and oil. The northern fishery, now enjoyed by France, was carried on by the planters, by proceeding in schooners, with necessary stores and skiffs, in the northern harbours of Newfoundland, much in the same way as the fishery is at present conducted at Labrador, and the schooners sent back with the fish to the respective merchants. The last fish brought home by the vessels being, like that sent in the autumn from Labrador, green, is discharged on its arrival into vats, or troughs, attached to the stages, and the salt washed off, when it is thrown on the stage, and piled into a *water-horse* to drain before drying. The fish cured in the northerly parts of Labrador is chiefly prepared in the cold, dry air. The western fishery, carried forward on the west coast of Newfoundland, is also, by treaty, abandoned to the French.*

Whenever the planter settles his account, in the fall of the year, with his merchant, and pays the wages of his servants, he prepares for winter, laying in provisions, &c.; and in the following spring he resumes the same laborious course of employment that occupied him during the preceding year.

* There is a whale fishery on the south side of the island, carried on by pursuing the whales in boats. The whale fishery within the Gulf of St. Lawrence will be found described hereafter. See account of the district of Gaspé.

HOUSES AND FOOD OF THE NEWFOUNDLAND FISHERMEN.

The fishermen's houses are one story high, built of wood growing on the island, and covered with boards and shingles imported from Prince Edward Island, Cape Breton, Nova Scotia, or New Brunswick. It was long customary to erect the walls with upright posts stuck in the ground ; but an improvement prevails by building the wooden walls on a stone foundation. Sometimes an additional building is joined called a " lean to," which is either in one room—a kind of parlour—or is divided into sleeping apartments. There is usually not more than one large fire-place, which is in the kitchen, and around which, in winter, all the inmates of the house assemble when the labours of the day are over. In the chimneys they smoke their salmon, or hang up the hams of the pigs reared in the island. On each side of the chimney there are often benches, with coops underneath for poultry, which, from the warmth of the dwellings, lay eggs all winter.

The usual diet of the people is made up of biscuit, potatoes, fish, salt pork, and bohea tea. Spruce beer is a very common and wholesome beverage, particularly for people who live much on fish and salt meat. The process of making it is simple. A few black spruce branches are chopped into small pieces, and put into a pot containing six or eight gallons of water, and boiled for several hours. The liquor is then strained and put into a cask that will contain eighteen gallons. Molasses is added in the proportion of one gallon to eighteen, a part of the grounds of the last brewing, and a few hops, if at hand, are also put in ; and the cask, filled up with cold water, is left to ferment ; in twenty-four hours it becomes fit for use. Spirits are frequently mixed with spruce beer to make the drink named callibogus. From the cheapness of rum, the labouring people, though by no means generally, acquire habits of drinking, which they have only resolution to resist by swearing, by the cross, or the gospel, that they will not taste rum or spirits of any kind. This act is called kegging, extending to one or more years and often for life.

The inhabitants are generally very healthy ; but from living much on flesh, fish, and oily food, fevers or small pox, when imported into the island from other places, are generally fatal, and occasion great mortality. Consumptions do not appear to be so frequent as on the continent of America. The air, though raw and cold, seems to invigorate the constitutions of the people ; and their strength in old age, when we consider the life of unremitting labour which they necessarily lead, is surprising : men and women at the age of eighty, are frequently observed attending the fish flakes.

The great and primary business of the people of Newfoundland is, that of pursuing and catching the inhabitants of the ocean. If habit, as it is generally allowed, becomes nature, the Newfoundlanders are naturally, from their pursuits, certainly the most adventurous and fearless men in the world. Courage and industry, which certainly prevail, are to them absolutely necessary.

The seal fishery, as it is generally termed, has only become important within the present century. It is little more than thirty years since the first vessels ventured among those formidable fields of ice that float from the northern regions during the months of March,*April, and May, down to the coast of Newfoundland. Those who are acquainted with the terrific grandeur, particularly during stormy weather, of the lofty islands and mountains of ice, covering often from 200 to 300 miles of the ocean, and occasionally arrested by the coasts or shoals, will admit, that it requires more intrepidity to brave the dangers of these elements than to encounter a military fortification.

LABRADOR.

Labrador Fishery.—During the fishing season, from 280 to 300 schooners proceed from Newfoundland to the different fishing stations on the coast of Labrador, where about 20,000 British subjects are employed for the season. About one-third of the schooners make two voyages, loaded with dry fish, back to Newfoundland, during the summer; and several merchant vessels proceed from Labrador with their cargoes direct to Europe, leaving generally full cargoes for the

fishing vessels to carry to Newfoundland. A considerable part of the fish of the second voyage is in a green or pickled state, and dried afterwards at Newfoundland. Eight or nine schooners from Quebec frequent the coast, having on board about eighty seamen and 100 fishermen. Some of the fish caught by them is sent to Europe, and the rest carried to Quebec; besides which they carry annually about 6000*l.* worth of furs, oil, and salmon to Canada. From Nova Scotia and New Brunswick, but chiefly from the former, 100 to 120 vessels resort to Labrador; the burden of these vessels may amount to 6000 or 7000 tons, carrying about 1200 seamen and fishermen. They generally carry the principal part of their cargoes home in a green state.

One-third of the resident inhabitants are English, Irish, or Jersey servants, left in charge of the property in the fishing rooms, and who also employ themselves in the spring and fall, catching seals in nets. The other two-thirds live constantly at Labrador, as furriers and seal-catchers, on their own account, but chiefly in the former capacity, during winter, and all are engaged in the fisheries during summer. Half of these people are Jerseymen and Canadians, most of them have families.

From 16,000 to 18,000 seals are taken at Labrador in the beginning of winter and in spring. They are very large; and the Canadians and other winter residents, are said to feast and fatten on their flesh. About 4000 of these seals are killed by the Esquimaux. The whole number caught produce 350 tuns of oil, value about 8000*l.*

There are six or seven English houses, and four or five Jersey houses, established at Labrador unconnected with Newfoundland, who export their fish and oil direct to Europe.

The quantity exported, in 1831, to the Mediterranean was about

54,000 quintals of codfish, at 10 <i>s.</i> per quintal	£27,000
1,050 tierces of salmon, at 60 <i>s.</i> per tierce	3,150

Salmon, &c.		3,220
Fish, &c., sent to Canada, about		12,000
Ditto, carried to Nova Scotia and New Brunswick, should be in value at least		52,000

Estimated value of the produce of Labrador, exclusive of what the Moravians }
 send to London* } £ 302,050

The Labrador fishery has, since 1814, increased more than sixfold, principally in consequence of our fishermen being driven from the grounds now occupied by the French.

The Moravians, whose principal settlement on the coast of Labrador is at Nain, have a ship annually from London, which leaves the Thames in May or June, and arrives at Nain in July, from whence it returns in September, laden with a valuable cargo of furs, oils, &c., for London. My inquiries respecting these people have not been successful. They fixed themselves in three different harbours of Labrador, about the middle of the last century. Their intercourse with, and settlements at, Greenland, led them to this region. Their habits are simple; and the quiet and unobserved life they lead is of a nature which leaves to few in America, or elsewhere, the knowledge of their existence. Their trade is wholly with the Esquimaux, in the way of bartering coarse cloths, powder, shot, guns, and edge tools, for furs, oils, &c.

NOVA SCOTIA, CAPE BRETON, AND ST. LAWRENCE FISHERIES.

These fisheries might be carried on to any extent which a demand for supplying the markets of the world would justify. The coasts of Nova Scotia which we have already described, abound with excellent harbours, admirably adapted for carrying on the fisheries. The inhabitants about St. George's Bay, the strait of Canso, Chedabucto Bay, and the opposite shores are mostly engaged in fishing; the country near the Atlantic being generally rocky and sterile, render the fisheries the more available occupations. Many of the inhabitants of Chester, Mahon Bay, Liverpool, and Shelburne, are also engaged in the fisheries. Cod, mackarel, herring, shad, allwives, salmon, halibut, sturgeon, sole, and other kinds of fish frequent the coast, and exclusive of gypsum, coal, and timber, the exports of Nova Scotia consist nearly altogether of the produce of the fisheries.

The cod and herring fisheries of Prince Edward's Island, which might be greatly increased, have, in consequence of the superior agricultural advantages of that colony, been chiefly confined to fishing for domestic use; and the same remark applies, with some exceptions, to the opposite shores of Nova Scotia and New Brunswick within the Gulf of St. Lawrence.

Within the Bay de Chaleur there have long been fishing establishments,

* These statements are made at the most depressed prices, and not at the average prices, which would increase the gross value to 342,400%. The Americans of the United States had, in the year 1829, about 500 vessels and 1500 men employed on the coast, and their catch amounted to 1,100,000 quintals of fish, and about 3000 tuns of oil; value altogether about 610,000%.

and the cod fisheries at Gaspé, Percé, Paspabiac, Shippigan, Caraquette, and other places; the salmon fishery in the river Rustigouche was formerly carried on at a profit and to a considerable extent.

BAY DE CHALEUR FISHERIES.—Two miles below Carlisle is the settlement of Paspabiac, inhabited chiefly by Acadian French, who employ themselves principally in fishing. There are, also, several people from Jersey, attached to the highly respectable fishing establishment of Messrs. Robins and Co. The harbour, or lagoon of Paspabiac admits only very small schooners and boats; but ships and large schooners ride safely at anchor in the road. The fish stores, flakes, &c., are ranged along a very fine beach, where the people connected with the fisheries are incessantly employed during the summer and autumn; in winter they retire back near the woods. Messrs. Robins' establishment was formed, I believe, about sixty years ago, by the elder partner and parent of the firm; and its admirable plan of systematic management, the essential characteristics of which are ceaseless industry, frugality, and prudent caution, and particularly in having no one engaged about the business that is not usefully or productively employed, has long secured to it the most solid prosperity. During summer, their ships, ten, or often more, in number, are moored in the road, with their top-masts and yards lowered, and the whole, I believe, given in charge to one master and his crew, while the other masters with their crews, are despatched in shallops to various parts of the bay, either to fish, or collect the cured fish from the fishermen who receive their supplies from Messrs. Robins and Co. In autumn, the ships depart with full cargoes of the best fish for ports in Portugal, Spain, and within the Mediterranean. They have, also, a ship-building establishment, where they have built a ship annually,* principally of larch. They are remarkably durable ships.

GULF OF ST. LAWRENCE WHALE FISHERY.—The whales caught within the Gulf of St. Lawrence are those called "humpbacks," which yield, on an average, about three tuns of oil; some have been taken seventy feet long, which produced eight tuns. The mode of taking them is somewhat different from that followed by the Greenland fishers; and the Gaspé fishermen first acquired an acquaintance with it from the people of Nantucket. An active man, accustomed to boats and schooners, may become fully acquainted with every thing connected with this fishery in one season. The vessels best adapted for the purpose are schooners, of from seventy to eighty tons burden, manned with a crew of eight men, including the master. Each schooner requires two boats, about twenty feet long, built narrow and sharp, and with *pink* sterns; and 220 fathoms of line are necessary in each boat, with spare harpoons and lances. The men row towards the whale, and, when they are very near, use paddles, which make less noise than oars. Whales

* One of those vessels which I saw moored in 1824, among the small fleet of Messrs. Robins in the bay De Chaleur, I went on board of afterwards, in 1839, in the port of Messina, where the vessel, then more than thirty years old, and perfectly sound, was discharging, in excellent condition, a cargo of dry codfish to feed the Sicilians.

are sometimes taken fifteen minutes after they are struck with the harpoon. The Gaspé fishermen never go out in quest of them until some of the small ones, which enter the bay about the beginning of June, appear; these swim too fast to be easily harpooned, and are not, besides, worth the trouble. The large whales are taken off the entrance of Gaspé bay, on each side of the island of Anticosti, and up the river St. Lawrence, as far as Bique.

With respect to the present state of the Gulf of St. Lawrence fisheries, the following extracts contain our latest information:—

“I intended to begin with the salmon fishery, its *decrease*, and the *causes thereof*; but at present I shall content myself by merely calling your attention to the lamentable state that valuable branch of industry is in at present, when contrasted with what it was formerly, when the Bay de Chaleur and its prolific rivers enabled us to export annually *thousands* of barrels; but now, unfortunately, a few *hundreds* is the maximum; all this occasioned by want of *proper* legislative regulations, but which, owing to the locality, requires *corresponding* enactments in the sister colony of New Brunswick. I have been engaged in the trade myself, and know a little on the subject.

“But, although the salmon fishery is of importance, the cod fishery is far more so, and to it I respectfully solicit your attention, whilst I attempt to point out the causes of its present decline on our shores, and which will, sooner or later, totally prove its destruction; for it is a lamentable fact, that in the upper part of the Bay de Chaleur, the cod fishery is each year decreasing; and where, a few years ago, abundance were taken, it is with difficulty the inhabitants *now* can catch enough for their winter supply. The numerous large deserted sheds and buildings going to ruin at Carleton, Maria, New Richmond, Bonaventure, and other places, is a convincing proof; and even at present, in the lower part of the bay, the fishery has so decreased, that the fishermen are compelled to go out to the *banks* in open boats, whereby many lives are annually lost, the poverty of the inhabitants not allowing them to build larger, and, consequently, more expensive vessels, in order to follow the fish to its deep water recesses; so that, in a very short period, I apprehend the shore fishery will be only remembered.

“The cause thereof is, the codfish are necessitated to desert our shores in consequence of the *destruction* of their *proper* and *natural* food, mackarel, herring, and caplin. The former, our neighbours, the Americans, have taken under their special protection, and we take immense quantities of the latter, not for eating, selling, or for bait, but for *manuring our lands*. I have known upwards of 500 barrels of caplin *taken in one tide*, expressly for that purpose, and have seen near 1000 barrels of herrings lying rotting on the beaches, having been caught, and never taken away; and, in the Bay de Chaleur, it has been remarked, that as *agriculture advances*, *fishery recedes*, owing to the causes above stated. The fishermen are well aware of this, and, at one of the general meetings under the Municipal Ordinance, endeavoured to make some regulations, and, by a petition to their warden, himself a fisherman, requested him to enforce them; but unfortunately, although he possessed the *will*, he had not the *power* to do so. The grand jury, also, in one of their presentments, besought the interference of the legislature, but as yet nothing has been done.”—*Letter addressed to the Members of the Canadian Legislature.*

Notes on the St. Lawrence fisheries, by Captain R. Fair, Royal Navy, lately commanding her Majesty's ship, Champion:—

“On the 21st of April, 1839, having arrived at the southern entrance of the Gut of Canso, we anchored in Inhabitation bay. This is a very spacious and well sheltered bay, of considerable extent, with excellent holding ground, from eight to nine fathoms water.

“There appears to be but little fishing carried on in this immediate neighbourhood. American fishing schooners, a great number of which passing through the gut, frequently stop to wood and water on the Canso shore; and I understand that many of the inhabitants (young men) enter on board of these vessels for the fishing season, receiving about twelve dollars per month, and in many instances, are induced to continue for the voyage, and finally leave Nova Scotia for the United States.

"It was not until the 29th of April, that the gut was sufficiently clear of ice to admit of our proceeding to the northward, when we got under way and ran through. Thence cruising through the Northumberland straits, and running along the coast of Miramichi, the Island of Shippingham and Miscou, we arrived in Gaspé bay, on the 3rd of May, and anchored abreast of Douglas town.

"We left Gaspé bay on the 9th, and passing by the fishing establishment of St. Peter's, Malbay, and Percée, anchored at Paspabiac (Bay of Chaleur) on the 10th May.

"This is by far the most important and most extensive fishing establishment in the gulf. It belongs to the firm of Robins and Co., who have very extensive stores at this place, they build ships of considerable burden, and send them, loaded with fish, to all parts of the world; their chief markets are the Brazils and Naples. They employ in the trade from this place, four ships, three brigs, and one schooner, amounting to about 1500 tons—their crews about 150 men.

"The fishing on this coast is entirely carried on in small boats, with two men in each, who, every evening, return on shore, when the fish is landed and cured. At the close of the summer fishing season (from the 8th to the 15th of August) all the fish caught at the several establishments, and along the coast, is brought in, and laden on board the different ships.

"After having ascertained the period when the fishing would commence on the coast, we left the Bay of Chaleur, and proceeded towards the Magdalen islands, where we arrived, and anchored in Pleasant bay on the 19th of May.

"We found the herring fishing had commenced, and in active operation in the several parts of the bay (chiefly in the little harbours of Amherst and House Harbour) by about 146 sail of American fishing schooners, of from sixty to eighty tons, and each carrying seven or eight men. Among them, were not more than seven vessels belonging to the British possessions, and they, chiefly from Arichat.

"The quantity of herrings was very great,* exceeding that of any former year; and the expertness and perseverance of the American fishermen, were far beyond that of the Arichat men. It is computed that the American fishing schooners average nearly 700 barrels each, and the barrel is valued at one pound sterling, making for the 146 sail, then in the bay, a presumed product of 100,000 barrels, value 100,000*l.* sterling; the tonnage employed, about 10,000; and the number of men, about 1000.

"We remained at the Magdalens† until the 27th of May, in which time several of the American vessels, having completed their cargoes, had sailed for their respective ports.

"Leaving the Magdalens, we touched at Pictou. There is no fishing carried on at Pictou. The country around, being agricultural, is rapidly improving; and the quick intercourse by steam with Prince Edward's island, promises to be of great advantage.

"We sailed from Pictou on the 3rd of June, and coasting around the east end of Prince Edward's island, again visited the bays Chaleur and Gaspé, and the coasts adjoining; and stretching over to Anticosti, landed on the east end, and examined the new lighthouse lately erected on Heath point: it was commenced in June, 1831, and finished in September, 1835. A few fishing shallops belonging to the Magdalens, were fishing off the east end, where they found cod in great abundance, and of excellent quality.

"Quitting Anticosti, we stood over for the Labrador coast, and on the evening of the 17th of June made Mount Isle. We cruised along the shore, westward, without meeting with a single sail, experiencing light baffling wind and thick weather, the current strong, and of uncertain direction. On the 22nd, we anchored in Mingan harbour. This is a safe, but very confined anchorage, there not being room in it sufficient for a vessel to lie at single anchor. The tide or current runs strong, and it requires a leading wind to enter or depart from it. Mingan is the principal establishment of the Hudson's Bay Company on this coast; and its outposts extend westward to the river St. John, and eastward to the Masquara, some distance from Mount Isle. The agent's house and storehouses are

* So plentiful are the herrings, that they are lifted out of the water into a boat, merely dipping it into the sea alongside as fast as it can be done.

† A curious anomaly exists in the government of these islands: they are under the jurisdiction of the Governor of Canada, at Quebec, from which place they are cut off, nearly half of the year, while they are open to Nova Scotia at all times.

situated close to the beach, and abreast of the anchorage. Mingan, although the first and most extensive establishment on the coast, does not appear to be of very great importance. The amount, or value of furs annually collected, does not exceed 4000*l.* sterling, and the salmon fishery is productive to about the same amount. It is said that the animals, as well as the Indian hunters, are rapidly decreasing. The salmon fishing at the several rivers, is carried on by two or three men (at most) at each river, except at Natishquan, which is their best and largest fishery: here seven men are stationed during the summer months, and their usual take, or catch, is about 180 tierces. Towards the end of July, all those men, with the produce of their labours, are taken up by the company's tender to Mingan, and thence to Quebec, the general depôt. The agent, and six or seven persons with him, remained at Mingan during the winter; but along the shore, or near the coast, there are no inhabitants, either Europeans or Indians.

"We sailed from Mingan on the 26th of June, and running along the western shore, passed the river St. John, and on the 28th, anchored in the Bay of Seven Islands. From this point, they fish only two rivers; and the quantity of salmon taken is very small, in fact, the produce of the establishments, has not, for several years, covered the expenses.

"On the 30th of June, we sailed from the Bay of Seven Islands, and continued to coast along the Labrador shore eastward, passed the Mingan islands, occasionally stretching over towards the Island of Anticosti. Along the shore eastward of the Mingan islands, the most striking and remarkable objects are the storehouses and flagstaff, at the entrance of the River Nabaysipie. Eastward of Nabaysipie, are some small islets, which afford protection to an anchorage for small vessels—it is called Little Natishquan. In this anchorage we found five shallops from the Magdalens, and a small French schooner from Miquelon, forced in, according to the master's statement, by the severity of the weather.

"Off this part of the coast is excellent cod fishing, and at times the Americans resort to this neighbourhood, but none have been seen here this year.

"In cruising near the east end of Prince Edward's island, and running along the shores, we observed a great number of American fishing vessels, but none *near* the shore, nor was there a single case which called for our interference, or where it was necessary even to recommend caution—on the contrary, the Americans say that a privilege has been granted to them, and that they will not abuse it. Between the east end of Prince Edward's island, to within seven leagues of the Bay of Chaleur, we passed through a fleet of from 600 to 700 sail of American fishing schooners, all cod fishing; it had not been a fortunate season for them, and great numbers had gone towards the Straits of Bell Isle for better success.

"The house of Janverin & Co., at Gaspé, exported in the year 1836 from 15,000 to 20,000 quintals of codfish, chiefly for the Brazils and South America. Other minor establishments export largely also—perhaps from Gaspé and its neighbourhood, the whole export may be about 40,000 quintals.

"From Gaspé we again stood over towards the Magdalen islands, but in crossing the Bradelle bank, where we had so lately seen above 500 fishing schooners, we did not meet with more than ten sail."

There are salmon fisheries on the coast of Labrador within the Gulf of St. Lawrence, and excellent salmon is caught in the various streams which fall into the St. Lawrence chiefly on the north side, especially in and east of the Saguhny river. Codfish is caught also at Grand Etang and several other places above Gaspé.

GASPÉ COMPANY.—A Company has lately been incorporated for fishing and other projects in the district of Gaspé, Lower Canada. At to the success of the company in the fishing branch of its project, and which we consider by far the most important, all will depend on judicious management. The most abundant cod-fishing banks, and shores, in the world are not excelled by those within the Gulf of St. Lawrence.

Extract from a recent official report on the "Fisheries of Nova Scotia."

"It is well known that the waters which lave our shores teem with the various species

of the finny tribe, and afford an inexhaustible mine of wealth to the industry of the fishermen. Probably in no part of the world are they surpassed, and, indeed, they form the envy of the surrounding nations. The extent to which they might be rendered productive is almost beyond any thing of which we at present have an idea. The Americans well appreciate the value of this trade, and the extent to which they carry it on at our very doors should teach us its importance. In 1837, which is the last year for which we have any return, the state of Massachusetts alone employed 1290 vessels in the cod and mackerel fishery, of the total burden of 76,089 tons. By these were employed 11,149 persons, by whom were taken 510,554 quintals of codfish, and 234,059 barrels of mackerel, valued at 3,203,559 dollars, or over 800,000*l*. From 700 to 800 vessels are said annually to pass through the Gut of Canso, which usually return home with large cargoes taken at our very doors. There is always a great deal said about their encroachments, and we are apt to blame them that our fisheries are not more productive than they are, and instead of engaging all our energies to compete with them, we are employing a host of revenue cutters, &c., to drive them from our shores. Every body must see that the Americans are placed under many disadvantages for prosecuting the fisheries in British waters, and that if proper enterprise were employed, our advantageous position would enable us not only to compete with them successfully, but also to drive them from our shores by underselling them in their own markets. But we find that they almost entirely monopolise our deep-sea fishery, while we look idly on, and grumble at their success. We are aware that the Americans impose a high duty upon our fish and other products, and that in the United States market they have in this respect a great advantage over the Nova Scotia fishermen; but these are necessary to the very existence of the American trade, and with all their bounties, duties, &c., we could compete with them in their own markets. As it is, large quantities are already exported thither, and this is rapidly increasing.

"That the fisheries are probably the most important branch of industry which Nova Scotia possesses, will be evident from a slight examination of the subject. Much of the land lying on the sea-coast is entirely unfit for the purposes of agriculture, and yet there are parts on which the ocean pours her wealth in the greatest abundance. Although we are of opinion that the fisheries of Nova Scotia have never been carried to their full extent, yet their amount at the present moment is sufficient to show their importance as a source of national wealth.

"In 1840, as appears from official returns to the house of assembly, and published in the report of the committee on deep-sea fishery, the *exports* consisted of 327,026 quintals of dry fish; 71,676 barrels, 1147 tierces, and 3643 kits of pickled fish; 27,755 boxes of smoked fish; 2553 barrels and 4661 casks of oil; and 17,735 seal skins—the value of which exceeded 500,000*l*., and the taking of which employed 60,000 tons of shipping; besides which there is the home consumption, amounting to nearly the same sum. It will thus be seen that the produce of the fisheries is one of our staple commodities, and the chief support of our foreign commerce.

"The committee on the fisheries, in the report to the house of assembly in 1843, says, that 'from returns laid before them it is apparent that in the eastern fishery, from the entrance of the Strait of Canso (that is, eastward of Halifax), including the island of Cape Breton, the inhabitants of Nova Scotia engaged as operative fishermen equal 5000 men, having upwards of 120 shallops and 1700 boats; and computing that an equal number are employed in the western and other fisheries of the province, an aggregate of 10,000 fishermen, 240 or 250 shallops, and 3400 boats, may be assumed as a fair statement of the fishing interest of Nova Scotia.' The same report says, that in the eastern fishery there are 10,000 nets employed, equal to 65,000*l*. in value. These calculations are small, and at any rate they exhibit the trade as not by any means so great as it should be.

"The facts we have now brought forward show the importance of this trade to the province, and we regret that it does not receive more attention than it has hitherto done. In the present depressed state of our provincial resources, it would be well to direct more of our energies to this branch of industry. The extent to which the inhabitants of the north-eastern province have been engaged in *ship building* has distracted our attention from it, and it must be allowed that we have not exhibited the same enterprise in this pursuit which our neighbours in the western parts of the province have done, and which our vicinity to the fishing-ground would enable us to exercise. *It is well known that large numbers of*

fish of various sorts, codfish, herring, mackarel, &c., annually visit the shores of this country, while scarcely any effort is made to turn them to advantage; and we have not the least doubt that some hundreds of industrious fishermen might be employed along this coast, by embracing the resources which nature has placed at our disposal."

According to the provincial returns, the exports of the produce of the fisheries from Nova Scotia were, during the present century, as follow, viz. :—

Taking the averages of the years 1805, 1806, and 1807, there were exported annually 81,191 quintals of dried fish, 43,299 barrels of pickled fish, 10,410 boxes of smoked fish, besides 652 smoked fish, such as salmon, &c.

In 1815, 1816, and 1817, 152,698 quintals of dried fish, 40,205 barrels and 170 kegs of pickled fish, 5675 boxes of smoked fish, and 379 smoked fish.

PRODUCE of the Fisheries Exported from Nova Scotia in the Year ending the 5th of January, 1833.

	£	s.	d.
160,640 Cwts. of dry fish at 10s.	80,320	0	0
37,154 Barrels of pickled fish „ 15s.	27,865	10	0
3,641 Boxes of smoked herrings „ 3s.	11,296	3	0

51,918 Seal-skins „ 1s. 6d.	3,893	17	0
Total	127,455	10	0

The number of ships employed in the trade was 570, and 640 boats.

In 1836, the shipments of cod, herrings, mackarel, salmon, and fish-oil, amounted to 186,908l., viz., 262,245 quintals of dry fish, 47,517 barrels of pickled fish, and 490 tuns of fish oil.

In 1837, Nova Scotia exported 427,140 quintals of dry fish, and 64,803 barrels of pickled fish. The value of the exports of fish in 1837, was 181,961l.; this was chiefly dry cod, but embraced, likewise, a considerable quantity of salmon, mackarel, and herrings.

In 1838, 434,309 quintals of dry fish, and 94,855 barrels of pickled fish.

From returns made in 1840, the produce of the fisheries was estimated at 274,810l. sterling, viz., 327,501 quintals of dry fish, and 66,417 barrels of pickled fish.

In 1837, Halifax exported of the above quantity of dry fish, 190,486 quintals; pickled fish, 28,646 barrels.—In 1838, dry fish, 201,826 quintals; pickled fish, 43,438 barrels.—In 1839, dry fish, 251,092 quintals; pickled fish, 51,035 barrels; while the custom-house returns from Arichat and Sydney, in the island of Cape Breton, show the exportation to be 41,328 quintals of dry fish, 10,794 barrels of pickled fish, 270 casks of oil; and the following quantities are fair estimates of the catch in other parts of Cape Breton, where no customs'-officers are stationed :—Strait of Canso, 2500; Port Hood, 500; Mahon, 2000; Marguerite, 5000; Cheticamp, 8000; Bay of St. Lawrence, 3000; Cape North, 4000; In-ganiche and Low Point, 8000; Bras d'Or, 3000; Mainadieu, 4000; Louisburg, 5000; l'Ardoise, 6000; making 51,000—clearly evincing that this valuable branch of industry, under every disadvantage, is furnishing an export equal to one million

annually ; while the internal consumption of the province, with a population exceeding 200,000, may be fairly estimated at 300,000 quintals.

The island of Cape Breton is admirably suited for the fisheries. St. Ann's, the Great Bras d'Or inlet, Sydney, and Louisburg harbours, afford excellent and safe seaports in the neighbourhood of the fishing banks.

A small variety of herrings, exceedingly fat and delicious, frequent the shores of the Bay of Fundy in May; and, about the end of the month, enter Annapolis Basin, where, on the shore of Clements, they have been caught in amazing quantities. They are usually smoked, or cured as red herrings, and packed up in boxes which hold each half a bushel, and contain about 200. A hundred thousand boxes of these have been exported during some years, but they are said not to be so plentiful as formerly.

In May, herrings of large size, full of spawn, arrive in nearly all the harbours of Nova Scotia, New Brunswick, Cape Breton, and the Gulf of St. Lawrence ; but these, although taken in great quantities, are poor, and not much esteemed. The spring mackarel are also lean, and not much valued, although they keep better than others in hot climates.

The fall herrings and mackarel are exceedingly fat, and much esteemed. The regulations, by legislative enactment, for inspecting the quality of fish packed up in the province, which must all be in new casks, have, although, complained of at first, established the preference for the pickled fish of Nova Scotia in foreign markets.

Crow harbour, and Fox island, both near each other, and within Chedebucto bay, have always (especially in autumn) been the great resort of mackarel and herrings. Nets are sometimes used, but the great bulk of the fish is caught with seines. These places, while the fishing season lasts, are generally the scenes of the most lawless disorder and licentiousness, occasioned by the violence of the fishermen contending for the best places to haul their seines ashore; the pillaging of the fish; the selling and drinking of rum; the smuggling of goods by the Americans; the exactions of those who possess the lands bordering on the shores; and often from the mere spirit of spoliation and mischief. A ship of war has been occasionally sent round from Halifax to preserve some sort of order among the multitudes of men, boats, and schooners, that resort to these harbours, and certainly these fisheries, from their great importance, require protection, and the establishment of regularity for their governance. We are informed that within the last few years, mackarel have not been so plentiful, or that they have rather deserted the above resorts.

A novel method of catching mackarel was some time ago discovered by the fertile genius of the Americans. This method is, simply, on arriving over the fishing grounds, to cut up, in very small pieces, a quantity of old pickled herring, or mackarel, for the mincing of which the Americans have also invented an in-

strument, and, on scattering the same in the sea, round the vessel, myriads of mackarel appear near the surface, when they are caught, as fast as they can be taken in, with a rod and line, the hook being baited with a small piece of shark or mackarel. Sprinkling salt on the surface of the water is said to have the same effect, but it is more expensive.

The whale fishery, which was carried on formerly with spirit from Halifax, was revived some years ago, chiefly by the enterprising house of Samuel Cunard and Co., when two ships were fitted out, one for the Pacific, and one for the Brudrel bank, and, among the crews, were sixty young men, natives of the province. The success of these and other whaling ships has been extremely variable, occasionally successful, and at other times probably carried on with much more loss than profit. Nova Scotia is certainly as well situated for the whale fishery as the United States.

FISHERIES OF NEW BRUNSWICK.

The cod fisheries of this province are carried on chiefly within the Gulf of St. Lawrence, at Shippegan, and Caraguette, within the Bay de Chaleur, and to a moderate extent within the Bay of Fundy.

The salmon fishery at the mouth of the river St. John's, has often been very productive. The shore is divided into lots, and these are drawn for every spring by the freemen of the city, the most valuable being worth about 200 dollars per annum. During the month of June, from 500 to 1000 salmon are taken daily, and the price varies from fifty to sixty cents a piece. There is an excellent fish market at St. John's, which is supplied at all seasons of the year with the different kinds of fish taken in the bay.

The whale fishery, began a few years ago, is said to have been profitable. In May, 1841, the St. John's Mechanics' Whale Fishing Company declared a dividend of twenty per cent, and in 1843 the company declared a dividend of 20s. a share equal to about fourteen per cent—on 7*l.* 4*s.* paid up capital. These dividends prove the company to be in a prosperous condition and must be highly encouraging.

The value of exports from New Brunswick in 1837, include 34,677*l.* for train oil, and 30,550*l.* for fish, chiefly dry cod, the whole of which was shipped, chiefly, to Britain and the West Indies.

Comparative statement of the quantities and descriptions of fish, exported from St. John's, New Brunswick, during the quarters between the 5th of July and 10th of October, 1841 and 1842, respectively.

PRODUCE.	1841	1842
Allwies	2368 barrels.....	3601 barrels.
Pickled herrings	516 barrels.....	519 barrels.
Dry fish.....	21 casks and } 10 boxes, }	227 casks and 348 boxes.
Soused salmon.....	845 kitts	718 kitts.

Pickled shad	192 kitts	100 kitts.

The produce of the fisheries was valued, in the three years 1832 to 1834, as under :—

PRODUCE.	1832	1833	1834
	£	£	£
Cod fish.....	28,231	27,536	46,337
Salmon.....	2,488	723	2,397
Herrings.....	1,032	318	489
Mackarel.....	212	91	382
Allwives.....	290	325	
Fish oil.....	1,038	2,290	1,560
Total.....	33,291	31,283	51,165

The produce of the fisheries in the country of Gaspé and the Magdalen islands, in 1836, consisted of—cod, 100,542 cwts. ; cod oil, 37,162 gallons ; whale oil, 25,120 gallons ; besides salmon and other fish, the whole amounting in value to 86,624*l*.

The future success of the British American fisheries must depend upon markets. Those of Europe are not, at least for several years, likely to increase the demand for salted or cured fish. The cause of diminished use of fish being the relaxations daily increasing in the abstinence from eating meat on fast days, and during Lent, in Catholic countries.

CHAPTER VIII.

FISHERIES OF THE UNITED STATES.

THE inhabitants of Massachusetts and of the other New England states began to carry on the fisheries, first, along the adjacent shores, and afterwards on the banks and coasts of Newfoundland and Nova Scotia. According to Mr. Pitkin's statements, before the revolutionary war, about 4000 of the inhabitants were employed chiefly in schooners and small craft, measuring about 20,000 tons. The average quantity of fish caught was about 350,000 quintals, value about 200,000*l*. When England acknowledged the independence of the old provinces, it was stipulated,

“By the 3rd article of the treaty of peace, between the United States and Great Britain, in 1783, ‘that the people of the United States shall continue to enjoy unmolested the *right* to take fish of every kind, on the grand bank, and on all other banks of Newfoundland ; also, in the Gulf of St. Lawrence, and at all other places, in the sea, where the inhabitants of both countries used any time to fish ; that the inhabitants of the United States shall have *liberty* to take fish of any kind on such part of the coast of Newfoundland, as the British shall use (but not to cure or dry them on the island); and, also, on the coasts, bays, and creeks of all other his Britannic Majesty's dominions in America ; and that the American fishermen shall have liberty to dry and cure fish in any of the unsettled bays, harbours, and creeks of Nova Scotia, Magdalen islands, and Labrador, so long as the same shall remain unsettled ; but so soon as the same, or either of them, shall be settled, it shall not be lawful for the said fishermen to dry or cure fish at such settlement, without a previous agreement for that purpose with the inhabitants, proprietors, or possessors of the ground.’

"For this favourable article," says Mr. Pitkin, "in relation to the fisheries, as in the case of the boundaries, the Americans were indebted to the firmness of their negotiators, and particularly Mr. Adams, who knew their value and importance to his countrymen. The British negotiators, for a long time, refused their assent to this article, and particularly to that part relating to the coast fishery, and which acknowledged the *right* of the Americans to take fish, on the grand banks, &c., and at last insisted on inserting the word *liberty*, instead of *right*. Upon this, Mr. Adams grew warm, and declared to the British negotiators, he would put his hand to no articles, without satisfaction about the fisheries; he asked, 'whether there was, or could be, a clearer right? In former treaties,' he said, 'that of Utrecht, and that of Paris, France and England have claimed the right, and used the word. When God Almighty made the banks of Newfoundland, at 300 leagues distance from the people of America, and at 600 leagues distance from those of France and England, did He not give as good a right to the former, as to the latter? If Heaven, in the creation, gave a right, it is ours, at least, as much as yours; if occupation, use, and possession give a right, we have it as clearly as you; if war, and blood, and treasure give a right, ours is as good as yours.

"We have certainly been fighting in Canada, Cape Breton, and Nova Scotia, for the defence of this fishery, and have expended, beyond all proportion, more than you; if, then, the right cannot be denied, why should it not be acknowledged, and put out of dispute? Why should we leave room for illiterate fishermen to wrangle and chicanery?" The British negotiators finally yielded this last point, and agreed to the article.

"The New England cod-fishery was nearly extinguished during the war of the revolution. It recommenced at the peace of 1783, but does not seem to have prospered, for, in 1790, the legislature of Massachusetts represented to Congress the embarrassed state of this fishery.† In consequence of a report made by the secretary of state, 'a bounty was granted by the general government, on the exportation of salted fish, by way of drawback of the duty on imported salt; and afterwards an allowance in money was made to vessels employed for a certain number of months in this fishery. From this encouragement, and the happy effects upon trade and commerce, produced by the establishment of the general government, the cod-fishery increased until the commencement of the embargo and commercial restrictions, in 1808, and the war between the United States and Great Britain, which followed. The British government considered the shore fishery, as it was called, as a *privilege*, granted at the peace of 1783, and which was forfeited or done away, in consequence of this war, and, therefore, refused to re-grant it without an equivalent. In the negotiations for peace, some of the American commissioners were disposed to renew to the British the right of navigating the Mississippi, as an equivalent for the shore fishery, but a majority of them were opposed to it; and the Treaty of Ghent, and the commercial convention which immediately followed, were both silent on the subject of the fisheries.'"—*Pitkin*.

* Diplomatic Correspondence, vol. 6, pages 493 and 495.

† "In 1790, the Marblehead fishermen petitioned to Congress for relief. In their petition they gave an exact statement of the earnings and expenses of the fishing schooners of that town for the three years preceding. For the year 1787, each schooner earned 483 dollars, while, in 1788, each earned 456 dollars, and, in 1790, only 273 dollars. The annual average of expenses, including insurance, was 416 dollars, thus showing a gain of sixty-seven dollars for the first of these three years, of forty dollars for the second, and a loss of 143 dollars for the third year. It is estimated, that the duty paid on articles necessary for a vessel of sixty-five tons, and eleven men, amounted annually to 138 dollars. The amount of duty on molasses was set down at ninety-nine cents, while that on rum was just fourteen dollars! This petition, as well as others of the same nature, were referred to Mr. Jefferson, then secretary of state, whose report, the next year, may be regarded among our most able state papers. But that report concluded with an explicit recommendation, 'that the fisheries are not to draw support from the treasury.' In 1807, four vessels were fitted out at Newburyport, for the Labrador cod-fishery. These were the first vessels from the United States, that made their fares in the Esquimaux bay."—*Newburyport Herald*.

"Some United States vessels, which attempted to carry on the cod-fishery on the British colonial shores, as they had been accustomed to do under the treaty of 1783, were seized by British cruisers; but, by the convention of October 20th, 1818, it was agreed, 'that the inhabitants of the United States, in common with those of Great Britain, should have the liberty to take fish on that part of the southern coast of Newfoundland, extending from Cape Ray to the Rameau islands on the western and northern coast of Newfoundland, from Cape Ray to the Quiepen islands; on the shores of the Magdalen islands, and also on the coasts, bays, harbours, and creeks, from Mount Jolly, on the south of Labrador, to and through the Straits of Bellisle, and thence northerly indefinitely along the coast; but without prejudice to the rights of the Hudson Bay Company.' And the American fishermen were also to have liberty to dry and cure fish in any of the unsettled bays, harbours, and creeks, by the southern part of the coast of Newfoundland, above described, and of the coast of Labrador; but, where such parts should be settled, were not to dry or cure fish, without the liberty of the proprietors of the ground. And, by the same convention, the United States renounce any liberty before enjoyed or claimed by them or their inhabitants, to take, dry, or cure fish, on or within three marine miles of any of the coasts, bays, creeks, or harbours of any of the British dominions of America, not included within the above limits. They were, however, permitted to enter such bays or harbours, for the purpose of shelter or repairing damages, of purchasing wood and obtaining water, and for no other purpose."

The Americans follow two or more modes of fitting out for fisheries. The first is accomplished by six or seven farmers, or their sons, building a schooner during winter, which they man themselves (as all the Americans on the sea-coast are more or less seamen as well as farmers), and after fitting the vessel with necessary stores, they proceed to the banks, Gulf of St. Lawrence, or Labrador, and loading their vessels with fish, make a voyage between spring and harvest. The proceeds they divide, after paying any balance they may owe for outfit. They remain at home to assist in gathering their crops, and proceed again for another cargo—which is salted down, and not afterwards dried: this is termed

mud-fish, and kept for home consumption. The other plan is, when a merchant, or any other owning a vessel, lets her to ten or fifteen men on shares. He finds the vessel and nets. The men pay for all the provisions, hooks, and lines, and for the salt necessary to cure their proportion of the fish. One of the number is acknowledged master; but he has to catch fish as well as the others, and receives only about twenty shillings per month for navigating the vessel: the crew have five-eighths of the fish caught, and the owners three-eighths of the whole.

The first spring voyage is made to the banks; the second either to the banks, Gulf of St. Lawrence, or the coast of Labrador; the third, or fall voyage, is again to the banks; and a fourth, or second fall voyage, is also made, sometimes, to the banks.

QUANTITY and Value of Dried and Pickled Fish Exported from 1791 to 1843.

YEARS.	DRIED FISH.		PICKLED FISH.

Hayti, and the Spanish and Danish West Indies, are the countries to which pickled fish has been principally exported from the United States. Of 102,770 barrels of pickled fish (herrings and mackarel) exported in 1831-2, there were exported to the Danish West Indies, 19,310 barrels; Dutch West Indies, 7612 barrels; British West Indies, 1992 barrels; Hayti, 29,476 barrels; Spanish West Indies, 21,560 barrels; and the remainder to various places. Of 42,274 barrels of pickled fish exported in 1840, there were exported to Danish West Indies, 5078 barrels; to Dutch West Indies, 3537 barrels; to Spanish West Indies, 12,672 barrels; to Hayti, 16,605 barrels; and the remainder to various places. The greater part of the pickled fish caught and cured by the fishermen of the United States is consumed at home.

The rivers of the United States, especially those of the New England states, are frequented by salmon, shad, and various other fish. The *shad* fishery is rather important.

Extract from report on this fishery:—

“The shad fishermen have been very successful the present season. It is estimated that 3000 barrels have been already taken in the Sound between Monomoy point and Bass river. The shad fishery on our shores was commenced by a few individuals four years ago. Now, between 200 and 300 men, principally from Connecticut, are engaged in it. The fish are taken with seines, of which two kinds are used; one made of great length and depth for the purpose of surrounding schools of shad where the water is from five to seven fathoms deep; and the other kind are fitted for meshing, the seine being trailed out from a boat or vessel, and the shad, in attempting to run through it, are caught by their gills. The long ‘purse seines’ require a crew of sixteen men to manage them, and are capable of holding an immense number of fish. Captain David Baker, took, at one haul, 200 barrels of shad, and Captain Judah Baker, also enclosed as large a number, but a shark broke through the seine, and made a passage for the shad to escape. Present appearances indicate that the taking of shad on our coast, will soon become as important a branch of business as the cod and mackarel fishery. We are informed that they have, at a certain season of the year, always been abundant in the waters of the Sound, but until recently, no means had been discovered for taking them in the open sea, in sufficiently large quantities to justify the expense of fitting out vessels on purpose to take them. It is believed that shad, like mackarel, in the spring, proceed northward along the coast, and that the fishermen, when they better understand their habits, will be enabled to follow

them as they now do the mackarel. They arrive in the Vineyard sound the last of May, or beginning of June, and then, as the weather advances, proceed northward along the coast as far as Nova Scotia. But the fact that they are taken very nearly as early in the rivers of Maine as in the Sound, seems to favour the supposition that they are a deep water fish, and only visit the coast in the months of May and June, to deposit their spawn."—*Hansard's Register for 1841.*

Salmon.—The rivers of Maine are those to which salmon resort more than to others. The *Portland Argus*, alluding to the salmon fishery of 1840, observes,

"Salmon are very plentiful this season. Dr. Drew of Augusta, says, that one morning lately, he noticed in the market, 150 that had been taken near our wharfs the previous night. Their weight, we should think, would be about seventeen pounds each. At ten cents per pound, this would make that night's fare worth 255 dollars. We understand that one has been caught in Bath this season, weighing seventy pounds. It was sent to Boston, for the epicures. They have been sold as low as eight cents per pound, though the price, when they first appear in market, is one dollar per pound."

MACKAREL FISHERY OF THE UNITED STATES.

This fishery is carried on chiefly from the New England states—chiefly from Massachusetts. In the ports of which there were inspected the following number of barrels of mackarel, during the years 1838 to 1842 inclusive, viz. :

The following sketch is interestingly descriptive of the mode of fishing at sea for mackarel.

Extract from "A Journal of a Mackarel Cruise :"—

"On the 6th of July, a fair wind carried us beyond the bar of Newbury port; in a few moments, and we were soon rolling and tossing on the briny deep. Before dark a thunder storm arose, which lasted all night.

"We sailed south, and on Friday morning was sixty miles south of Nantucket, but did not fall in with any mackarel until Saturday, when we were called to our lines before dawn of day, by the skipper, who, holding the morning watch, had discovered that there was a *scool* around us. They bit well for about *three-quarters of an hour*, and we salted seven barrels that morning. It was at this time that I learned the process of taking them.

"Every person has two lines, with two hooks on each, and even when the fish are most plentiful, an experienced hand can with perfect ease tend two lines, while a tyro finds difficulty in preventing one from becoming entangled, as he draws in the fish or throws the line out again. Mackarel always go in *scools*, but it is not every *scool* that will bite; when they will not bite they are said to be '*scooling*.' In this case, they are seen in large numbers, with their heads nearly out of water, swimming with great swiftness, sometimes in a direct line, and sometimes round and round, having the appearance of being frightened. A *scool* can be seen half a mile distant, and whenever one is perceived, the vessel endeavours to 'run into it,' and stop it by throwing bait among them, which they some-

times succeed in doing. This bait, which is used for the purpose of keeping the *scool* about the vessel, consists of other fish taken on board in port, and salted. It is ground up very fine in a 'bait mill,' and always used while fishing. The hooks are baited with a small piece of fish taken from the throat of the mackarel that are caught, and when this cannot be procured, with pieces of pork. They bite very quick, much like a pickerel, and must be drawn in the instant they are felt touching the hook. There is no mercy shown to the fish after he is taken; by a sudden jerk of the line the hook is torn from his mouth, and he falls into a barrel or on deck. Frequently, after they cease biting, the remainder of the *scool* is seen swimming about near the surface of the water, in which case, they are 'gaffed,' or hooked up, with an instrument called a 'gaff,' which is an iron or steel rod, two feet long, bent at the end like a hook, but without a beard, and attached to a pole about six feet long. When the fish have all disappeared (probably sunken), the fishermen proceed to dress, wash, and salt those caught, which is done with such despatch by those practised in the business, that in *less than an hour* after we had ceased fishing, seven barrels were salted, and the crew's work ended for the day.

"Mackarel seldom ever bite except early in the morning, or just at night, and since they are not found every day, there is much leisure time on board a fishing vessel, which is the dulllest part of the voyage. Such time is employed by the crew in making miniature vessels, catching various kinds of fish for amusement and to eat, and in sleeping. The fishing business is very uncertain; one may fall in with mackarel, and return home fully laden with them in four or five days, or may cruise about till the stores are all exhausted, without finding any.

"We coasted along Cape Cod for about three weeks, catching a few mackarel now and then, but found them rather scarce, and what few there were, very small. Cape Cod is, from the water, the most dreary looking place that I ever saw. As you sail along you see nothing but a sand bank, with two or three huts upon it, which have been erected for the benefit of shipwrecked sailors, who might chance to be washed on shore alive. It is no terror, however, to fishermen, as they are not there during the stormy part of the season. The greatest danger fishermen are in, is of being run into by other vessels during a fog, which is sometimes so thick that you can see but little more than the length of the vessel. Such an accident occurred to a vessel that was near us almost all the trip, and she was obliged to put into the nearest port.

"One morning, the skipper spoke a vessel from the Bay of Chaleur, with 100 barrels of mackarel, that reported them plentiful in that bay. The skipper, thinking it was not best to remain there when he heard of mackarel elsewhere, immediately set sail and steered for home, to take a new fit-out for the Bay of Chaleur. The next day we were alongside of the wharf we sailed from. Thus it is with fishermen, whenever they hear that mackarel have been caught in any other place, they all set sail for the spot, but nine times out of ten, they learn, too late, that the fish are somewhere else. Many fishermen have (as I am told) been living almost entirely upon hope, for two or three years past, expecting soon to find mackarel plenty, and to catch their share of them. Some, last year, did not catch the amount of fifty barrels, which would not pay their outfits. They are led to suppose that they shall do well before long, because there was *once* a time when they found mackarel plenty, and, because even now, occasionally a vessel is fortunate enough to make a good trip. But the business must, undoubtedly, be dropped by many of them, for it is evident that mackarel are pretty well caught up, and will never again be so plenty as they have been.

"If any class of people ought to be well paid for their labour, it is the fishermen, for theirs certainly is a hard life. As they go in small vessels, they cannot enjoy even many conveniences that seamen do on board large vessels, and they are obliged by necessity, to live among much filth. They cannot carry with them a great assortment of provisions, and being out almost all the summer season, they are deprived of fruits and many of those productions of the soil, which in the season of them, furnish landmen with so many luxurious dishes."

LAKE AND RIVER FISHERIES OF THE UNITED STATES.

The fisheries of the lakes, and especially of Lake Huron, are of very considerable value. The following account of those fisheries is extracted from the *New York Merchants' Magazine* for 1842.

“ The larger lakes, as well as the interior waters of the state, abound in fish, some of them of the most valuable sorts, which are now taken in Lake Superior during the summer by the American Fur Company, whose traders are found scattered at widely separated points along its shores. Among those of a superior sort are the Mackinaw trout, the white fish, sturgeon, salmon trout, muskelunjuh, pickerel, pike, perch, herring, the rock bass, the white and black bass, catfish, trout, and gar, which constituted, during the earlier condition of the country, a very valuable article of food, as they do now of commerce. Among the most prominent of these are the white fish, which are not only peculiar to the lakes, but from the first colonisation of the territory by the French explorers, have been highly celebrated ; large quantities of trout, as well as the white fish, are taken upon the lakes and shipped to Ohio, New York, and Pennsylvania.

“ The subjoined statement derived from the *Detroit Daily Advertiser*, exhibits the progress of the lake fisheries at different periods, from 1835 to 1840 :—

“ “ With the immense business which is destined to be done on the western lakes, that of the fisheries should not be overlooked, as it has already become a considerable item of exports. The number and varieties of fish taken, are worthy of notice, and it is stated that no fresh waters known, can, in any respect, bear a comparison.

“ “ From the earliest period of the settlement on the shores of the lakes, fishing has been carried on to supply the inhabitants with a part of their food, but not until the past five years has fish become an article of export. Since that time, the business has rapidly increased. The number of barrels taken, so far as information can be gathered, in 1835, was 8000, and in 1840, it reached 32,005 barrels.

“ “ The weight to which some of the fish attain is unparalleled, except in the Mississippi —as follows :—

NAMES OF FISH.	Greatest Weight.	Average.	NAMES OF FISH.	Greatest Weight.	Average.
	lbs.	lbs.		lbs.	lbs.
Sturgeon	120	70	Perch	1	
Trout	60	10 to 2	Roach	1	
Muskelunjuh	40	10 „ 15	Black Bass		2 to 3
Pickerel	15	5 „ 6	Bill fish		6 „ 8
Mullet	10	3 „ 6	Catfish		10 „ 20
White fish		2 „ 3	Sisquoele		8 „ 10
At the Sault Ste. Marie		4 „ 5			

“ “ The varieties usually taken for pickling, are trout, pickerel, white fish, and sisquoele ; the latter, however, is to be found only in Lake Superior.

“ “ Since the projected canal at the Sault Ste. Marie has been suspended, Yankee enterprise, at great expense, in the absence of artificial locks, has surmounted the difficulty of getting over the falls leading from Lake Michigan to Lake Superior, and within the two past years, two vessels, by means of slides, rollers, &c., have reached the upper lake.

“ “ Three vessels have, also, been built on Lake Superior by the American Fur Company. The two former vessels will hereafter be engaged in the fishing trade, in freighting salt, provisions, &c., to various points on the lakes, and returning with fish. Heretofore the American Fur Company have monopolised the trade. This will open a new era in the upper lake fisheries, as they are said to be inexhaustible.

“ ‘From the following table, of the amount of fish barreled, which was obtained from various sources, the rapid increase of the business will be seen :—

	1836	1837	1840
	barrels.	barrels.	barrels.
Lake Superior.....	2,000	5,500	10,000
Mackinac	1,200	800	4,000
Sault Ste. Marie	300	600	2,555
Green Bay.....	600		
Various points on Lake Huron.....	500		
Fort Gratiot	3,100	4,100	3,000
Shores of Lake Huron	500	600	
On Detroit River	4,000	2,500	3,550
Shores of Sanilac County			500
St. Clair River			1,000
Drummond's Island.....			800
Twin Rivers			1,500
Mouth of Mannistee River.....			1,000
" Sheboygan River			275
Racine River.....			225
Saginaw Bay			500
Thunder Bay.....			500
Beaver Island			500
South Saginaw Bay			500
Total	12,200	14,100	35,005

“ ‘The average price of fish, per barrel, for the past five years, in Detroit, is eight dollars, which gives a total value of the business, in 1840, at 256,040 dollars. Thus, in its infancy, it adds this large amount annually to the wealth of Michigan.’ ”

In the Mississippi and other rivers, various fishes, which we have already described, abound. Of some of the lakes near the delta of that river, the following account is curious :—

“ One fact, however, distinguishes the summer of 1839. It is the drying up of the lakes in the Mississippi swamp—at least in that portion of it in Adams county, extending from below Natchez to Ellis' cliffs, north and south, and from the highlands of St. Catharine creek to the Mississippi river, east and west. This occurrence, so far as the writer's inquiries extend, is unexampled, and is, at least, a striking proof of severe drought. In company with a friend, on a hunting excursion of a day or two, in the last week in September, we visited several of these lakes. They are almost entirely dry, and can be crossed anywhere on horseback. They form beautiful meadows of various extent, from 100 yards to 200 yards in width, and from half a mile to two miles in length, covered with luxuriant and tender grass.

“ *The myriads of fish that once swarmed in these lakes, have all perished.* As the water recedes to the centre, they naturally crowd to that point, and as these reservoirs fall, also, the eagles and vultures, and fish eating vermin of all kinds, flock in vast numbers, to such a feast as is seldom spread to them. In the deeper and larger lakes, a few inches of water were found in the centre, not sufficient to cover the dying fish, and stained with blood drawn from them by the talons of their ever vigilant and insatiable foes. The remains of those that were dying and bleaching in the sun, covered large spaces, and presented to the eye an appearance, to use the words of an old hunter, ‘like leaves after a frost.’

“ These lakes have, for ‘time, whereof the memory of man runneth not to the contrary,’ been the habitation of numerous species of fish, from the *grim garr*, that shark of these fresh waters, to the diminutive *pan-fish*. The winter rains will again restore water to their basins, but another great overflow of the Mississippi can alone supply them with their ordinary inhabitants. Even the amphibious alligator will have small temptations to return to them; for his usual supply of provision has failed. At present, they are covered with an exuberant coat of grass, without any object to interfere with the view, extending, in some of them, almost as far as the eye can reach. Upon these meadows the cattle and horses find a plentiful subsistence; and the venison of this season is uncommonly fat and delicate, owing to the superabundance of pasturage.

“ It will suggest itself to the mind of a medical man that millions of fish, thus perishing, and corrupting, must affect the atmosphere. Such is the fact; and before reaching the open bed of the lakes, the effluvia becomes extremely offensive.”—*Hansard's Register*.

CHAPTER IX.

WHALE FISHERY OF THE UNITED STATES.

THE Norwegians were accustomed at an early period to capture whales. But they only did so, as they now do in the Orkney and Shetland islands, when whales arrived casually on the coast or in the bays. The Biscayans were the first people who pursued the whale fishery as a regular business. They carried it on with energy, perseverance, and success, from the twelfth to the fourteenth century. The voyages of the Dutch and English to the Northern Ocean, for the purpose of discovering a passage to India discovered multitudes of whales in those seas, which led the Dutch and English to enter upon the northern whale fishery. During the middle of the seventeenth century, houses were established upon the northern coast of Spitzbergen, and provided with tanks, boilers, and all other necessary apparatus for the purpose of boiling the blubber, and preparing the bone for market. A town with shops and taverns arose in consequence. The town disappeared with the whale fishery. The Dutch whale fishery was in its most prosperous state during the year 1680, when it employed about 260 ships, and 14,000 sailors. The English whale fishery was carried on by an exclusive company, like that of Holland; and in 1725 the South Sea Company embarked in the whale fishery, and prosecuted it with vigour for about eight years, and then abandoned it, with considerable loss. The French and some other nations embarked in the pursuit with great success.

It is recorded in the second volume of the "Philosophical Transactions," in a letter from Mr. Richard Norwood, who resided at the Bermudas, "that the whale fishery had been carried on in the bays of those islands for two or three years. A year or two afterwards, the whale fishery was proposed by a Mr. Richard Stafford, who remarks that he had killed several black whales himself. 'I have been,' says he, 'at the Bahama islands, and there have seen of this same sort of whale (the spermaceti) dead on the shore, with *sperma* all over their bodies! Myself and about twenty others have agreed to try whether we can master and kill them, for I never could hear of any of that sort that was killed by any man, such is their fierceness and swiftness.' 'One such whale,' said he, 'would be worth many hundred pounds.'"* New Providence, in the Bahamas, became soon afterwards distinguished as a whale fishing station. Before the English colonists killed whales in America, "the Indians upon the shores of North America were accustomed to adventure out from the coast in their canoes, and pierce them with their lances, or other instruments of the same kind, which were fastened to blocks of wood by strings. These blocks were thrown overboard the moment

* See Philosophical Transactions, vol. ii.

that the instruments penetrated the body, and the attacks thus made appear to have been renewed the moment the whale showed himself on the surface, so that these monsters were finally worried to death. The attacks thus made by these imperfect instruments seem, however, to have been generally directed upon the young ones near the shores, that were towed to the coast, and the fat taken off from only one side, as they possessed no knowledge which would enable them to turn over the animal. It is obvious that the larger sort of whales must have effectually resisted the attacks of the savages with such rude weapons, and the demand for the oil, which, upon the northern part of the continent, they were accustomed to use as food, was but limited.”*

The New England, or American whale fishery, was commenced in the island of Nantucket. It was colonised by an adventurous and hardy race of settlers from other parts of Massachusetts. The origin and progress of the New England whale fishery is related as follows, in the *Merchants' Magazine*:—

“It appears that one of the species called ‘scragg’ was descried in the harbour of the infant colony, where it remained spouting and gambolling around the shore for three days. Measures were soon adopted by the settlers, who were the original purchasers of the island, for its capture. An harpoon, rude in its form, was invented and wrought; and, after a severe contest, the monster was taken. The success of this adventure induced the people of that place to commence the enterprise of taking whales as a regular business, these animals being at that time very numerous around the coast; and, as early as 1672, we find the inhabitants entering into a formal contract with James Lopar, in which he engages to carry on the ‘whale citching’ jointly with the town, for two years, on their giving to him ten acres of land in some convenient place, with commonage for two cows, and twenty sheep, and one horse, together with the necessary wood and water. The town were, by this contract, bound to carry on two-thirds of the business, and himself the other third. This company was to have the monopoly of the trade, and no other company was permitted to engage in the traffic, unless they should tender to this first organised body a portion of its shares. It was also provided, that ‘whosoever kill any whale of the company or companies aforesaid, they are to pay to the town, for every such whale, five shillings.’ John Savage, a hardy New England man, was also procured to settle upon the island in the capacity of a cooper, upon nearly the same terms which had been made by the proprietors of the town with Lopar. We may suppose that the profits of this crude frame of enterprise were small, but they were at least sufficient to induce the prosecution of this species of traffic.

“Meanwhile, the people of Cape Cod had reached considerable proficiency in this branch of enterprise, and their success induced the fishermen of Nantucket to adopt more vigorous and systematic measures for its prosecution. Accordingly, we find the inhabitants employing Ichabod Paddock, as early as 1690, to instruct them respecting the best manner of taking the whale, and extracting the oil. The whaling expeditions from that port were then carried on in boats from the shore, and the white colonists derived important aid from the Indians, who manifested extraordinary aptness for the fishery of all kinds, and, being placed in responsible stations as boat-steerers and headsmen, they soon became experienced and valuable whalemén. These boats, in search of their game, often ventured even out of sight of the land during the pleasant days of winter, and performed feats which are scarcely exceeded in our own day. After the whale had been killed, he was towed ashore, and an instrument, termed a ‘crab,’ and which was similar to a capstan, was used to ‘heave off’ the blubber as fast as it was cut. This blubber was then placed upon carts, and conveyed to ‘try-houses,’ situated near their dwellings, where the oil was boiled out, and prepared for market. For the purpose of enabling the fishermen to descry whales at a distance, a high spar was erected upon the shore, with cleats affixed to the top, where the whalemán,

* Hunt's Magazine.

with his spy-glass, could be securely lodged, and command a broad view of the ocean. No sensible diminution of the whales upon the coast appears to have existed from the first thirty years of the fishery, although eighty-six were taken near the shore during the year 1726, and eleven were sometimes towed to the land in one day.

"We are informed that the first spermaceti whale, known to the inhabitants, was found dead and ashore upon the south-western part of the island; and here arose several conflicting claims to the right of property in this dead monster; the Indians claiming it by right of finding; the whites, on the ground of their ownership of the island; and the officer of the crown seizing it by virtue of the well-known principle of the laws of England, giving to the king certain property which is discovered to have no visible owner, and, in discussing which, Mr. Justice Blackstone, if we remember right, specially designates a stranded whale. The matter was, however, at length adjusted, and the white men who first found it were permitted to hold the property, the whale having been previously divested of his teeth.

"To Christopher Hussey, a Nantucket whaleman, belongs the honour of capturing the first spermaceti whale, and his feat was performed during the year 1712, so far as can be ascertained. This man, while cruising near the shore for 'right whales,' the species which had been the principal kind captured by the Nantucket whalers, was blown off from the shore, and falling in with a school of that species, he succeeded in capturing one and towing him into port. This event gave a new impulse to the whale fishery upon the ocean, for vessels of thirty tons were soon built for the purpose of extending this traffic. These vessels were fitted out for cruises of about six weeks, and carried a few hogsheads capable of containing the blubber of only one whale, which, after they had captured, they returned home, when the owners took the blubber and prepared the oil for market, despatching the ship upon another voyage. The boiling was done in try-houses, which were erected near the landing, and the outfits and apparatus were placed in warehouses, situated near the same place. The substitution of vessels for boats constituted a new epoch in the expeditions of these Nantucket whalers, as the whales were expected to be diminished; and, in 1715, the number of vessels engaged in the whaling business from this port was six, all of them sloops of from thirty to forty tons burden, and producing 1100*l.*, amounting in our currency to 4888 dollars, 88 cents.

"Such was the germ of the whale fishery in this country, and circumstances transpired which were calculated to extend its operations. Larger vessels were soon introduced as motive for the business increased, and the enlargement of their number of course required an additional number of men, so that the island could not furnish the force to man their ships. This deficiency was, however, supplied by seamen from Long island, as well as various parts of Cape Cod. But the consumption of oil did not increase with the augmentation of the number of the ships and the quantity of oil which was obtained. Indeed, the domestic sale was frequently dull, and the whale fishermen began to look to a foreign market. Boston at this time, furnished the chief depôt for the oil of the Nantucket whalers, and it was customary for the merchants of that city to order large quantities of whale oil from Nantucket, and to export it to England in their own vessels, from which traffic they derived a considerable profit, the oil of the island having obtained a very high reputation in Europe. This fact aroused the people of Nantucket to their true interest, and they immediately adopted measures to export the products of the fishery themselves, and accordingly to reap the profits. But although the prospects of success appeared bright, they moved with great caution in this matter, knowing that the failure of their enterprise would be attended with disastrous consequences. Accordingly, about the year 1745, a small vessel was loaded and despatched to Europe with a cargo of oil. The expedition was successful, and their shipments to England and other foreign ports were increased. This new field of enterprise was attended with a double advantage, for while they secured large profits on these voyages, it was found that the articles in the foreign ports to which their ships were consigned, consisting of iron, hardware, hemp, and sail cloth, were precisely of the kind which they wanted for the trade, and, being purchased at a cheap rate, they were admirably adapted to their return cargoes.

"But in the year 1755, the loss of several fine ships, with their crews, by the perils of the sea, or by capture—for it is well known that we were then at war with France—

threw a temporary blight over the traffic, although it continued to increase. The ships were enlarged in size, from thirty to 100 tons burden and more, as whales had become scarce upon their own ranging grounds near the shore, and larger vessels were required to advance further into the ocean. A number of the larger class of vessels was despatched to Davis's straits and the Western islands, being provided with complete outfits, and, while a few made great voyages, others came home 'clean,' from the ignorance that then prevailed respecting the courses of the winds, the proper feeding-ground of the whales, and of all those other facts which could only be acquired by experience. Whaling continued to be the main occupation of the inhabitants of that island, while the attempts which were made to carry on this pursuit in other parts of the country, appear to have failed.

"Another fact tended to diminish the profits of the whale fishery at that time. The English government, discovering that oil was far preferable to other light, being better adapted to common use, and less expensive, became anxious to increase that branch of commerce from her own ports, and, in consequence, granted a large bounty to this species of industry. By that means it was much enlarged, and London soon became an important whaling port. The necessary consequence of this measure was to cut off Nantucket from a considerable portion of its foreign market; yet the American whale trade was not sensibly diminished, as its consumption was enlarged in various parts of the world, and even the exportation to England continued to be carried on. As new coasts were explored, the field of the whale fishery became enlarged, and the American whale fishermen adventured widely into the ocean for their favourite game. The places at which the whale fishery commenced, and the periods when it was begun, prior to our revolution, we have in the subjoined table, which is believed to be accurate:—

"At Davis's straits, in the year 1746.

"The Island of Disco, in the mouth of Baffin's bay, in the year 1751.

"Gulf of St. Lawrence, in the year 1761.

"Coast of Guinea, in the year 1763.

"Western islands, in the year 1765.

"Eastward of the Banks of Newfoundland, in the year 1765.

"Coast of Brazil, in the year 1774.*

"Besides these places, whaling voyages were carried on to a considerable extent, although for a shorter period, upon the Grand Banks, Cape Verd islands, numerous points of the West Indies, the Bay of Mexico, the Carribean sea, the coast of the Spanish Main, and various other parts of the sea. The amount of enterprise invested in the traffic at different periods, and the profits of the voyages at this early stage of the fishery, may, perhaps, be interesting at the present time, exhibiting as they do the progress of the trade in this country.

THE Number of American Ships employed, and Oil produced from the Catch, for Ten Years.

"It appears, also, that the price of whale oil in England was, in 1742, 18*l.* 13*s.* per ton; in 1743, 14*l.* 8*s.* per ton; in 1744, 10*l.* per ton; and in 1753, 21*l.* per ton.

"From the year 1771 to 1775, the whale fishery increased to a most important extent, and the hardy islanders of New England, who formed the whaling companies, were mechanics, who manufactured the cordage, the casks, the sails, the iron and wood work of the ships, and even built the ships for the whale fishery. According to Mr. Pitkin, Massachusetts alone, during that space of time, employed annually 183 vessels, of 13,820 tons

* See History of Nantucket, by Obed Macy.

burden in the northern whale fishery, and 121 vessels, of 14,020 tons in the southern, which were navigated by 4059 men; the produce of the fishery at that time amounting to 350,000*l.* lawful money, or 1,160,000 dollars. At this time, a large portion of the spermaceti oil was sent to England in an unseparated state, the head matter being generally mingled with the body of the oil, commanding, as it did, the same price when in a mixed, as in a separate state. A considerable portion of the oil procured from the right whale was shipped to Boston, or other parts of our American colonies, for inland consumption, or was exported to the West Indies. The manufacture of sperm candles, which was first commenced in Rhode Island, in 1750, was carried on to a considerable extent in New England and Philadelphia, and tended to furnish a motive for the fishermen to procure this species of matter. We here append a table, showing the amount of American whale fishery from 1771 to 1775.*

STATE of the Whale Fishery in Massachusetts, from 1771 to 1775.

"A few years previous to the revolution, the average price in market for spermaceti oil was about 40*l.* per ton, and for head matter 50*l.* per ton. Common whale oil was about 15*l.* per ton, and the bone was worth about 2*s.* 4*d.* per lb.

"The 'Massachusetts' Bay Restraining Bill,' tending to restrict the commerce of New England, excluded their whaling ships from the banks of Newfoundland; but a special relaxation of the law was made in favour of Nantucket, on account of a petition from the island to that effect.

"Nantucket was found, after the revolutionary war, the principal mart of the whale fishery, in an impoverished condition. The 150 vessels which it owned at the commencement of the war, were dwindled down to a few old hulks, and the grass grew green in the streets; but the characteristic energy which had marked the enterprise of its sturdy settlers, soon exhibited itself upon its old field, the ocean, and the sound of the broad-axe and the hammer were again heard in its dockyards, building and refitting new vessels for its favourite enterprise. In 1785, the business promised great profits. The articles required for the outfits were low, while the price of oil was high. This state of things continued only a short time, for in the latter part of the succeeding year, crude sperm oil sold for 24*l.* per ton, and head matter scarcely commanded 45*l.* per ton. Measures were soon adopted to petition for its protection, and a bounty was granted by the commonwealth of Massachusetts, of 5*l.* for every ton of white spermaceti oil, and 60*s.* for every ton of brown spermaceti oil; for the purpose of encouraging the business, many persons in other parts of the country were induced to embark in the whale fishery, thus increasing the quantity in this country, and diminishing its value. But the consumption was not sufficiently large to make its procuration very profitable; and the encouragement to this commerce which had been given by England, and the consequent quantity carried by their own mariners into that country, cut off American whaling merchants from British markets, especially as

* Pitkin's. Hunt's Magazine.

duties were required to be paid for its importation to Great Britain, after the war of the revolution."—*Hunt's Magazine*.

"Halifax, in Nova Scotia, affords an excellent harbour, opening directly from the Atlantic, and it was thought that a good market would be there provided for whale oil. Inducements were held out to the people of Nantucket to remove there, in 1786 and 1787, and a considerable number settled on a spot opposite Halifax, called Dartmouth, when there were built dwelling-houses, wharfs, spermaceti candle manufactories, stores, and dockyards. Here they carried on the whaling business for several years with success, but were finally induced to remove to Milford Haven, in the west of England, there to prosecute the whale fishery. Nantucket suffered considerably by this settlement, having lost some of its most active and enterprising whalers, still the auspices of the whale fishery grew brighter, oil advanced in price, the number and size of the ships were increased, their voyages were extended, and the vessels from that port which had confined themselves to the West Indies, the coast of Guinea, and different parts of the shores of North America, now extended their ranging grounds to the banks of Brazil, where right and sperm whales were very numerous. The manufacture of sperm candles was increased, and large quantities were not only consumed in this country, but also exported to the West Indies. About this time the domestic consumption of oil was much extended by the establishment of light-houses, and the introduction of machinery into the country; one branch of domestic industry thus aiding the other. In fact, the enterprise invested in this labour was enlarged to such a degree, that the little island of Nantucket, could not furnish sufficient seamen to carry on the whaling voyages from her own port, and many Indians and negroes were imported from the continent, who resided on that island, and became some of the most valuable and active agents of the whale fishery."—*Hunt's Magazine, Pitkin*.

"In 1790, the attention of the people of Nantucket was directed to the seal fishery, profitable voyages for the capture of these animals having been made previously from England, the seals being found upon the same coasts as the whales, and requiring the same outfits and men. The first expedition fitted out from New England was for the coast of Africa. It was not successful, but laid the foundation of a business which has been since prosecuted with energy and profit. During the succeeding year, a number of successful cruises having been made by the English vessels upon the western coast of South America, these foreign enterprises induced the people of Nantucket to range with their ships upon the same coast, and whaling ships then first adventured from this port to the Pacific Ocean, and almost invariably returned with full cargoes. The success of the whalers of Nantucket in the whale fishery induced the people of the neighbouring settlement of New Bedford, which has since arrived to great opulence by this traffic, to increase the number of their whaling ships; and, in 1792, they had enlarged their adventures to a considerable

extent. The market for oil was at this time also very much extended in France ; lamps were sent into that country from England, to encourage its use ; and large shipments were made from the United States, which proved profitable ; but the revolution that afterwards broke out in that country swallowed up all foreign enterprises. The period which the historian of Nantucket has denominated its ' golden age,' was soon turned to an age of bronze by the circumstances of the period, for while the French revolution effectually prevented the importation of the article into that country, most of the foreign markets became glutted; the price of oil in foreign ports fell below that for which it could be obtained in Nantucket, the provisions required for the outfits advanced in value, and ruin stared the whalemén in the face. In addition to these disastrous circumstances, war between France and the United States was expected while the whaling ships afloat were out upon long voyages, and commercial disaster, like the foreboding twilight of an eclipse, overshadowed this important branch of the commerce of the country.

" But notwithstanding all the difficulties which followed, we learn that in 1810 most of the business capital of the island of Nantucket was at sea, and, during that year, six or eight ships were fitted out from that port for the Pacific Ocean. But dark clouds now gathered again upon the commercial sky, and a war with England was threatened. The people who had been engaged in the traffic were soon deprived of the means of subsistence; and, while the motives for adventure in the traffic diminished, the premiums of insurance arose to twenty per cent. Two years afterwards, an embargo was laid upon our commerce, which restriction is generally a sure presage of war. Seven-eighths of the capital of Nantucket were afloat, three-fourths of which were not expected to return for a year; and so great was the apprehension of the declaration of war, that a formal petition was despatched to the British government by the people of Nantucket, through Admiral Cochrane, asking protection for their commerce, and expressing a willingness to remain neutral in the belligerent operation which succeeded. But all this was of no avail, and the navigators of that island, diverted from their ancient business, were left to starve, or to gain a scanty subsistence by fishing around the coast, or by cultivating its barren soil.

" At the close of the war of 1812, the country, it is well known, was involved in one common wreck ; but the elastic energies of the nation revived, and the whale fishery was commenced upon a new foundation, and has been advancing with a gradual and solid growth to the present time. During the year 1819, it was extended to many points along the coast of New England ; and whale ships were fitted out from New York, Long Island, New London, New Bedford, Cape Cod, and Boston, which have been increasing to the present day, constituting a source of great wealth to the beautiful settlements that are scattered along our northern maritime shores, as monuments of the liberality and enterprise of that high-minded class of men, our American whaling merchants. The growing population of the country, and the increased consumption of the articles produced by the whale fishery from the introduction of machinery ; and the multiplied branches of trade requiring them, together with the more efficient organisation of this enterprise, and the security to its prosecution furnished by the strength of our government, will render it in coming time, as it now is, a lucrative and permanent field of commerce."—*Hunt's Magazine*.

According to Mr. Pitkin, the whole number of vessels engaged in this fishery, in the winter of 1834, was 434, of which, about 384 were ships, and fifty barks and brigs.

The greatest part of these, belong to New Bedford, and Nantucket, and New London. The following is the number of vessels, in these three districts, with their tonnage, and number of men employed, furnished us by the collectors of these districts.

DISTRICTS.	No. of vessels.	Tonnage.	Men.
New Bedford	181	56,352	4445
Nantucket	76	264,72	1860
New London.....	41	11,251	1081
Total.....	298	94,075	7392

" The remaining number, being about 136 from the best information obtained, belong to the following ports :—

PORTS.	No. of vessels.	PORTS.	No. of vessels.
Sag Harbour	23	Portsmouth.....	6
Falmouth	6	Bridgeport.....	1
Warren	12	Newburyport.....	3
Bristol	13	Edgerton.....	6

Hudson	11	Boston	4
Providence	2	New York.....	5
Fall River.....	2	Wareham.....	1
Poughkeepsie.....	3	Portland	1
Plymouth.....	5	Wiscasset	1
Gloucester.....	2	Greenport.....	2
Newburgh	3		

" The number of vessels employed in the sperm fishery, from New Bedford, was 112, with a tonnage of 37,163, and 2828 men ; and from Nantucket was sixty-nine, with a tonnage of 24,216, and 1684 men. The number, from the other ports, in the same fishery, may be estimated at about eighty, making the whole number, in the sperm fishery, about 261, and in the right whale fishery, about 170.

" The value of the ships employed in the former, with their outfits, has been estimated, by those well acquainted with the business, at 30,000 dollars each ; those in the latter, at 15,000 dollars, and the barks and brigs may be estimated at 10,000 dollars. The following, therefore, may be deemed the value of all the vessels, employed in the whale fishery from the United States, about the 1st of January, 1834, including their outfits.

	dollars.	dollars.
261 ships, in the sperm fishery at	30,000	7,830,000
120 " " right whale fishery „	15,000	1,800,000
50 barks, brigs, &c. „	10,000	500,000
Total	. .	10,130,000

" The entire tonnage of the whaling vessels, in the districts of New Bedford, Nantucket, and New London, as above stated, was 94,075 ; and if we estimate the tonnage of the vessels, in the other ports, in the ratio of the number of vessels, in these three places, the whole tonnage employed in the whaling business, may be stated at 136,000, which is not far from one-tenth of the whole tonnage of the United States ; and by the same ratio, the whole number of men employed, would be about 10,900. The men usually have for their shares, three-tenths of the earnings.

" In 1830, it was calculated, that the following, among many other articles, were consumed by the whale ships.

" Thirty-six thousand barrels of flour ; 30,000 barrels of beef and pork ; 18,000 bolts of duck ; 6,000,000 of staves ; and 2000 tons of cordage.

" The consumption of these articles, as well as others, must have increased since that period.

" About one-half of the common whale oil, finds a market in Europe, one-quarter in the West Indies and South America, and the other quarter in the United States.

" Nearly the whole of the spermaceti oil is consumed in this country ; from one-quarter to one-third being used in the cotton and woollen manufactories ; and in this indirect way, one branch of domestic industry is materially benefited by another.

" And we cannot but observe in this place, that the temperance now practised on board most of these whale ships contributes, in no small degree, to the success of these long and hazardous voyages. We are happy to be able to state, that, in April, 1834, no less than 168 of the whale ships of New Bedford, were what are called temperance ships, furnishing no spirituous liquors, except for the medicine chest.

" Great Britain formerly gave a high bounty on vessels employed in the whale fishery :

but this bounty ceased in 1824. A duty, however, on foreign oil, was continued, amounting, in the case of spermaceti oil, to a prohibition.

"The South Sea fishery was not prosecuted by the British, until about the commencement of the American revolutionary war. The greatest number of ships engaged in it, in any one year, from 1814 to 1824, when the bounty ceased, was sixty-eight, tonnage 19,755, and employing 1827 men; and, in 1830, only thirty-one ships, with a tonnage of 10,997, and 937 men; and these ships were from the port of London."

OUTFITS OF WHALE SHIPS.

"The outfits required for a whaling ship constitute no inconsiderable item of the expense, amounting, in a vessel which is fitted out for a three years' voyage, to no less a sum than 18,000 dollars, while the hull not unfrequently costs 22,000 dollars more, while many have sailed whose total cost does not vary far from 60,000 dollars. The principal kind of provisions required for the crew upon their voyage, consists of beef and pork, bread, molasses, peas, beans, corn, potatoes, dried apples, coffee, tea, chocolate, butter, besides from 3000 to 4000 casks, made from white oak, and a quantity of spare duck cordage, and other articles which may be required in the course of the voyage. In a ship which mans four boats, from thirty to thirty-two men are employed. The contract entered into between the crew and the owners of the ship, and contained in the shipping articles that are required to be signed by each sailor, makes it binding on the owners to provide the ship and all the necessary outlays of the voyage; and upon the crew to perform their duty on board the ship, obeying all proper orders to the end of the voyage. As a compensation, they are entitled to such part of the oil, or whatever else may be obtained, as shall be agreed upon for their services; and if, in case of death or accident, any portion of the crew is unable to perform his part of the voyage, they or their legal representatives are empowered to draw, in their own right, whatever of compensation would have fallen to their share had the voyage been completed, this compensation being proportioned to the time they shall have served. The 'lays,' or shares of the captain, officers, and crew, are measured by the amount of their experience and value in the voyage."

The annexed enumeration of the quantities of many articles of foreign and domestic produce required in the outfit of whale ships, which sailed during 1841, is derived from the *Nantucket Enquirer*—good authority on all matters pertaining to this branch of commerce. The American whalers have increased from a few frail boats, hardly venturing from the shore, to a fleet of 650 sail of 190,000 tons burden, a monument reared upon the broad ocean, where the world may sail and read the chivalrous and enriching results of New England perseverance, energy, and industry. Other nations have not been negligent in encouraging this fishery; but in all cases with but little good effect. Notwithstanding bounties, loans, royal grants, and monopolies, have been showered upon the adventurous whalers of other nations, the fishery has died under these lavishments until America and New South Wales only import enough for their own consumption:—

This extensive branch of the trade of this country is placed in a shape, in the following table, that shows the import, export, and value of the export of the produce the hardy sons of the east obtain from the depths of the fathomless ocean.

THE following is a Statement of the Quantity (in barrels) of Sperm and Whale Oil Imported into the United States, from the 1st of January, 1834, to the 1st of August, 1843.

Y E A R S.	Sperm.	Whale.	Y E A R S.	Sperm.	Whale.
	barrels.	barrels.		barrels.	barrels.
1834.....			1839.....	142,336	229,783
1835.....			1840.....	157,791	207,908
1836.....	128,686	131,157	1841.....	159,304	207,348
1837.....	181,723	219,133	1842.....	163,637	161,041
1838.....	132,356	216,552	1843, to August 1.....	113,986	160,617

THE following is a Statement of the Quantities and Value of Sperm Oil, Whale, and other Fish Oils, and Whalebone, Exported from the United States, annually, from the 1st of October, 1836, to the 30th of September, 1842:—

Y E A R S.	S P E R M O I L.		WHALE AND FISH OILS.		WHALEBONE.	
	Quantity.	Value.	Quantity.	Value.	Quantity.	Value.
	barrels.	dollars.	barrels.	dollars.	lbs.	dollars.
1836.....	4,925	119,787	794,990	1,049,466	731,500	187,008
1837.....	5,619	151,875	115,047	1,271,545	1,129,500	223,682
1838.....	5,295	137,809	153,154	1,556,775	1,634,570	321,458
1839.....	2,731	85,015	47,076	515,484	1,445,098	284,790
1840.....	13,797	430,490	143,519	1,404,984	1,892,259	310,379
1841.....	11,091	343,300	130,124	1,260,660	1,271,363	259,148
1842.....	9,135	233,144	124,118	1,315,411	918,280	225,382

By the above tables, it will be seen that the imports have been so fluctuating that the business appears to be on the decline. Such is not, however, the fact. More ships are in commission this year than ever before; but the vessels afloat have not been as successful, comparatively, as in former years. The additional number engaged will swell the imports up, by the 1st of January, 1844, to an amount larger than any previous year.

The whole number of vessels employed in the whale fisheries, out of the ports of the United States, is 645, belonging as follows. In 1843 :—

PORTS.	Ves-sels.	PORTS.	Ves-sels.	PORTS.	Ves-sels.	PORTS.	Ves-sels.
	No.		No.		No.		No.
New Bedford	217	Wareham	7	Fall River	7	Bridgeport	3
Fairhaven	45	Provincetown	16	Freetown	1	Sag Harbour	44
Falmouth	6	Plymouth	7	Portsmouth	1	Cold Spring	3
Edgartown	10	Newburyport	1	Providence	8	Greenport	7
Holmes' Hole	3	Boston	4	Bristol	8	Hudson	1
Nantucket	85	Lynn	2	Warren	20	Poughkeepsie	2
Dartmouth	1	Salem	8	Newport	12	New York	2
Westport	11	Somerset	2	Stonington	20	Wilmington (Del) ..	3
Sippican'	7	Ducksbury	1	Mystic	8		
Mattapossett	10	New Suffolk	1	New London	50		

Of the 645 vessels employed, only 112 were in port on the 22nd instant, leaving 533 vessels afloat, actively engaged in obtaining cargoes. Many of these vessels are daily looked for, and the reports of those absent exhibit a very favourable condition of the trade.

Sperm oil does not bring in this market so high prices as it used to in previous years; but whale oil and whalebone are at present in active demand, at as fair prices as we have quoted for some years past.

The prices of sperm and whale oil, and whalebone, from 1838, to 1842, inclusive, were as follows:—

YEARS.	Sperm Oil.		Whale Oil.		Whalebone.			
	cts.	cts.	cts.	cts.				
1838.....	75	to 97 av. 83	30	to 37 av. 32	17	to 21	av. 19½	
1839.....	98	„ 110 „ 103	30	„ 39 „ 34½	17	„ 19	„ 18½	
1840.....	90	„ 106 „ 100	30	„ 32 „ 30½	15	„ 22	„ 19	
1841.....	81	„ 105 „ 94	30	„ 36 „ 31½	18	„ 23	„ 19½	
1842.....	64	„ 92 „ 73	32	„ 38 „ 33½	20	„ 32	„ 23	
1843.....	53	„ 78 „ 63	31	„ 40 „ 34½	26	„ 50	„	

Average prices for the six years above, are—

Sperm oil.....	cents. 86
Whale oil.....	32 5-6
Whalebone.....	22½

The *New Bedford Shipping List* gives the following estimate of Ships and Oil to arrive in 1844:—

	Sperm.	Whale.
	barrels.	barrels.
There are seventy-two sperm whale ships which may arrive in 1844 (that will be thirty-six to sixty months out), with 15,000 barrels sperm, and 120 barrels whale each	108,000	10,800
Three sperm whale ships that may arrive in 1844 (that shipped a part or the whole of their sperm oil home in 1843), with 500 barrels sperm and 500 barrels whale each ..	1,500	1,500
One hundred and six two-season right whalers that may arrive in 1844, with 1950 barrels whale and 250 barrels sperm each	26,500	206,700
Ten one-season right whalers may arrive in 1844, with 100 barrels sperm and 1400 barrels whale each	1,000	14,000
Forty Atlantic sperm whalers that may arrive in 1844, with 275 barrels sperm and twenty-five barrels whale each	11,000	1,000
Estimated quantity to be sent home from outward-bound whalers, &c.	3,500	
	148,500	234,000
Deduct for oil to be sold in South America		8,000
Total	148,500	226,000

American System of Whale Fishing.—When sailors' wages are high at New York or Boston, they are difficult to be procured; for the whalefishers are paid by *lays* instead of wages. These *lays* are of course dependant upon various circumstances; but, generally, the captain's lay is one-seventeenth part of all which is obtained; the first officer's, one-twenty-eighth part; the second officer's, one-forty-fifth; the third officer's, one-sixtieth; the boat-steerer draws from an eightieth to a hundred-and-twentieth; and the common sailor before the mast, from a hundred-and-twentieth to a hundred-and-fiftieth, according to his experience, activity, and strength. On the outward passage, the crew are divided into two watches, similar to those which exist in the merchant service.

The American whaling ships generally pass to the Pacific, by the way of Cape Horn; some sail by the eastern route, south of New Holland; others pursue the whales in the Indian Ocean, the vicinity of Madagascar, and the Red Sea, reach the Pacific through the straits of Timor, between New Guinea and the Pelew Islands, and sail to the coast of Japan. Every part of the Pacific is explored by the hardy and bold American whalefishers, and many new discoveries have been made by them.

The right whale is of the largest class. These were taken by the Americans as far back as in 1761, in the Gulf of St. Lawrence; they are said to have produced 230 barrels of oil; and as the vessels then employed did not exceed sixty tons' burden, a single whale made a full cargo. The bone from a whale of this size, sometimes weighed 3000 lbs., each of which was worth a dollar, and the slabs were frequently ten feet in length. Their food consists of a species of animal not larger than a spider, and similar in form, called "bret," which swim near the surface of the water, and tinge it for acres with a reddish cast. The difference between the right whale and the sperm is known at a distance by the manner of spouting. The right whale has two spout holes, and throws the water in two perpendicular streams, that widen as they rise. The "hump-back" and the "fin-back" spout in the same manner. The sperm-whale spouts in a single stream, thrown forward from its head, at an angle of about forty-five degrees.

A sperm whale, about sixty feet long, is usually about twenty-four feet in circumference; the distance from one point of the tail to the other is about seven feet. The length of the fin is about three feet and a half; about fourteen feet being the length of the jaw-bone. The spout-holes, or nostrils, are situated about ten inches from the end of the nose; from which to the eyes, the distance is not above fourteen feet. The skin is about the thickness of one inch; the blubber, on the ribs, about five inches, and upon the breast nine inches; the blubber being about one-sixth part of the whole of the animal. Whales of eighty feet long, have the blubber thicker in proportion.

The head of the sperm whale is in size equal to one-third part of the size of the body, has a blunt appearance, with a front like the breakwater of a ship, and at its junction with the neck, there is a large hump or bunch. From what might be named the shoulder, is the thickest part of the body, about one-third of its length, until what is called the "small," or beginning of the tail, where there is another hump seen, and from which a smaller ridge runs down towards the extremity, to the "flukes" or fins of the tail. The "flukes" consist of two triangular, horizontal fins, about six feet long, and twelve or fourteen feet broad, in those of the largest size. The great power of the muscles of these flukes, renders them a formidable means of defence, and an object of terror to the whaleman. In the upper part of the head there is a large triangular cavity, which is called the "case," containing the oily fluid that after death is congealed into that yellow, granulated mass, which we name spermaceti. Beneath this *case* and the nostril, there is a thick mass of substance, elastic in its nature, which is called the "junk," and formed of a *cellular tissue*, and infiltrated with *fine sperm oil* and *spermaceti*. The mouth extends throughout the whole length of the head, containing in the lower jaw forty-two teeth of formidable dimensions, and when open, it is as capacious as a middle-sized room, and the roof is covered with a kind of coarse hair, through which it strains the food. The throat, unlike that of the Greenland whale, is large enough to admit the body of a full-grown man. The eyes are small, situated far back on each side of the head. They have eyelids, the lower ones are moveable. A short distance behind the head are the swimming fins, which appear to serve them not only for the purpose of swimming but to hold their young. The size of a full-grown sperm whale is estimated to be about eighty-four feet in length; the depth

of the head from eight to nine feet, and the breadth five to six feet; the swimming fins about six feet long and three broad; and the circumference of the body thirty-six feet. The skin of the sperm whale is smooth and without scales. The colour of the skin is dark over the greater part of its surface, but especially so on the upper part of the head, the back, and near the flukes, where it is quite black; on the sides it is of a lighter shade, and on the breast silvery gray. Aged "bulls," as they are termed by whalers, frequently have a portion of gray on the nose, above the fore part of the upper jaw, and these are then said by whalers to be "gray-headed." The blubber encircles the body, and is termed by the sailors "the blanket." It is of a light yellow colour, and when melted down, becomes the sperm oil. The ordinary food of this species of whale appears to be a sort of sepia, or cuttle-fish, called the squid.

The ordinary motion of the whale is slow, swimming, as they do, at the rate of from two to four miles an hour; but they can go through the water at from ten to twelve miles an hour.

"The sperm whales herd in large schools, the females being protected by from one to three of the other species. The males appear jealous of intrusion, and fight with great power to prevent it. The large whales generally go alone in search of food, and when seen in company, are supposed to be travelling from one 'feeding ground' to the other. These large whales being quite incautious, are easily overcome, and, even after the plunge of the harpoon, often lay exposed to their destroyers like a log of wood, scarcely appearing to feel the blow. Sometimes, however, they are found possessing extraordinary courage, doing dreadful havoc with their principal weapons, their jaws and tails. They breed at all seasons, producing one, and sometimes two, at a birth, the size of their cubs being, when first born, from twelve to fourteen feet. The females are much smaller than the other sex, being not more than one-fifth part as great. These manifest strong attachment to their young, taking them under their fins, and urging them to escape from danger. Their attachment to each other is no less remarkable, and, when one is wounded, its companions will remain around her to the last, so that they often fall a sacrifice to their affection. The attachment, on the part of the young, towards its parent is no less extraordinary, and they are often seen around the ship for hours after their parents have fallen a prey to the harpoon. The young males swim in schools until they are about three-fourths grown, when they separate, and seek their prey upon the ocean alone. The difference between them and the female droves is evident and striking, from the fact that when one of their number is struck, it is left to its fate, scarcely an instance being known of its companions having 'heaved to.' They are cunning and shy, and, accordingly, are more difficult to take, as, from their vigour and activity, great despatch is necessary, in order to give them no opportunity to recover from the terror and fright occasioned by the blow of the harpoon. One singular circumstance may here be mentioned, that the whale, both great and small, appears to have the power of communicating intelligence to its kind, when any danger approaches, for the distance of four, five, or even seven miles; but the mode in which this is done has never been ascertained.

"The 'fin-back' whale is an animal of larger size than the sperm, but so uncertain and active in its motions as to elude the most expert whale fishermen.

"The 'right whale,' another species, which, with the sperm whale, constitutes the most prominent staple of our whale fishery, we have considered. It is similar in its general form to the sperm, and possesses the same general habits, although the oil extracted from it is of inferior quality. There are also other species, such as the razor-back, the broad-nosed whale, and the beaked whale; and species of a smaller kind, to which we shall merely allude.

"The wide domain of the ocean is the home of the whale, and we find it spouting in every latitude of the sea, from the icebergs of Greenland to the African coast. It is admitted, however, that the sperm whale is seldom seen in the colder latitudes, confining itself to the more genial climates; while the Greenland whale, which is of extraordinary size, appears to delight in tumbling among the mountains of ice which float in the region of the north pole. We find the whale fishermen hurling the harpoon upon the coast of New Zealand, as well as New Holland, near the shores of Peru and Madagascar, Chili and California, Japan and the China sea, the Red Sea and the Persian Gulf. It is, indeed,

not unusual for the whaling ships from our American ports to ransack the world for their gigantic prey, entirely circumnavigating the globe, although the enterprises of the British whale fishermen are directed more particularly to the coast of colder climates."—*Hunt's Magazine*.

The American whale ships are generally from 300 to 500 tons burden, and carry from twenty-eight to forty men, besides officers. They are provisioned with all necessary stores for three years. Sometimes the ships are accompanied by what are called "tenders," or smaller vessels, which serve as convoy to the principal ships, and that either aid them in distress, or themselves procure the whale. Each ship is provided with four or six whale boats, about twenty-seven feet long, and four broad, in which the whale is generally captured. These boats are strong and light, sharp at both ends, in order to withstand the action of the waves, to float with great buoyancy upon the tops of the billows when the sea runs high, and to be propelled both ways. Near the end, which may be considered the stern of the boat, a rounded piece of wood is placed, called the "loggerhead," through the hole of which the rope is run which is attached to the harpoon. Each boat has two lines, of about 200 fathoms in length, and carefully coiled in their tubs in a circle, four harpoons, and some lances. They are also provided with small flags, called "whifts," which are stuck in the dead whale, in case the whalers are driven off from their object by untoward circumstances, and in order that their position may again be found. A few "drogues," or quadrangular pieces of board, are likewise provided, and fastened occasionally to the harpoon-ropes, so as to impede the motion of the whale after he has been struck. Besides some articles of refreshment, each boat has also a keg, containing a tinder-box, lanterns, and other articles, to enable the fishers, when benighted, to strike a light. The boats are each manned by six men, two of whom are called the "headsman" and "boat-steerer." In chasing the whale, four of these boats are used.

The principal instruments used in the whale fishery are the harpoon, the lance, the spade, and the try-pot. The harpoon is an iron spear, about three feet in length, with a barbed point, and is required to be of the best iron; while the "shank," which is frequently bent by the struggles of the whale, must be of pliable and soft iron, for the purpose of enabling it to bend, if required, but not to break. The lance is also an iron spear of about six feet in length, and into which is fitted a handle of wood; its point is sharp and thin, the blade being seven or eight inches in length, and two and a half broad. This is used to wound the whale in a vital part after it has been struck, so as to cause its death. The spade, another instrument similar to the lance, is used to cut up the blubber into small pieces; and the *try-pot*, a large iron tank with three legs and two flattened sides, is used for boiling the blubber into oil.

The harpoon gun, invented in 1731, was formerly used for the purpose of throwing the harpoon into the body of the whale, which could be done with effect at the distance of forty yards; but, as great skill is required in its management, and numerous accidents have occurred from its use, the instrument has been relinquished.

The seamen, or whale fishers, are among the most ardent, daring, and, in many instances, the most reckless class of the American coast population, "comprised," as observed in an article in *Hunt's Magazine*, "of young men who are unwilling to devote themselves to those slow and persevering habits, that minute and scrupulous attention to detail required in the successful prosecution of any form of business, and that plodding and unvaried labour which is always exacted by the cultivation of the soil; they are bold, warm in their imaginations, impulsive, generous, and, from their mode of life, cast about as they are by storms from sea to sea, wide in their range of view, and devoid of the stability which would induce them to be confined long to any one place. Their habits of adventure in attacking the monsters of the deep upon their native element, give to their character a hardihood which could scarcely be acquired by any form of occupation upon the land. The day-book and the ledger, those mighty engines which form important parts of the machinery of commerce, have no charms for them. In the words of one of our most distinguished jurists, 'upon their native element, they are habitually buffeted by winds and waves, and wrestling with tempests; and, in time of war, they are exposed to the still fiercer elements of the human passions.'

"Accustomed to strict subordination by the discipline which the law has provided for

our whaling ships, to toil and deprivation when on duty, their hardships are mingled with glimpses of sunshine in its intervals. The natural ardour of their character appears to break out, when they are relieved from its burdens, and have their foothold once again upon the land. Their views become as expansive as the broad ocean which stretches around them, and their impulses as wild as the waves which dash against its shores. Conscious that they are all embarked in one common enterprise, hazardous in the extreme, in which the success of the voyage is the measure of their rewards, and mutually depending upon each other for success, their affections become kindled into sympathy for their companions ; and this feeling operates always upon the land, so as to induce them to sacrifice their own comfort to that of their friends. The money which they have procured by the most severe toil, they are ever ready to spend liberally in every form of indulgence, by dissipation ; and their loose habits of economy and want of calculation, frequently cause them to fall a prey to those greedy 'land sharks,' which always show their fins in great numbers through all our seaport towns.

"With such habits, to which there are many and honourable exceptions, it could hardly be expected that the great body of sailors should accumulate large fortunes. The earning of years of toil are expended in as many months at the bar or the brothel ; and the sailor, stripped of his means, has only the last resort, to ship again and resume his march upon the mountain wave, and return to his home upon the deep. Dressed in red woollen shirts, coarse pantaloons, pumps, and tarpaulin hat—removed, as they are, from the restraints of the civil law, and without those habits of reflection which would arise from the more steady and sober pursuits of the land, they frequently exhibit riotous habits, which would lead one to think that they were exempted from the jurisdiction of the laws.

"The most prominent exceptions to this class of men, are those who have arisen by successive steps from the station of common sailors to that of boat-steerers, and to the posts of captains of their ships. These are, for the most part, temperate in their habits, with physical and moral powers fully adequate to bear the great responsibilities which devolve upon them, and to stand at the head of these stormy expeditions. We see many along our coast who have acquired fortunes by their business, and the beautiful houses which whiten our shores attest the success of their labours. A few remarks may be proper in this place, respecting the discipline of the whaling ships, which is permitted by our laws. In the first place, it is well known that the ships which ply from our ports are chiefly owned by different individuals, who combine their capital in this species of stock usually to a large amount of value. Not only is the custody of the ship, which is of great cost, but also that of the outfits and crew, and the prosecution of the voyage, intrusted to the keeping of a single man, the captain of the ship. Numerous sailors, of diverse and frequently insubordinate habits, are placed under his control, and on their obedience depend not only the success of the expedition, but even the safety of their lives. The law gives to the master of the ship a despotic power within certain prescribed bounds. It invests him with entire and full command of his ship, with the right to inflict personal chastisement upon those who break its discipline, to control the operations of the crew, and generally to exercise the same government that a schoolmaster exerts over his scholar, or the parent over his child. Doubtless many acts are committed on the part of the master which are founded in injustice, but then the sailor has his remedy by bringing his action for civil damages in a court of law. It has, indeed, been our lot, during a limited professional practice in a seaport town, to have frequent applications from sailors claiming maltreatment on board ship from their captains, which, however, proved to furnish no ground for a legal claim of damages. Certain old 'law salts' are always found on board ship ready to give in their advice when a sailor has been unjustly punished, or chastised with improper weapons ; and a jury away from the coast, it is well known, are seldom backward in awarding damages full as great as the injury. Doubtless, extraordinary discretion, forbearance, and determination, are required on the part of the master, to exercise the power which the law gives him for the purpose of preserving discipline on board his ship, and thus carrying out the objects of the voyage ; but how many acts of insubordination on the part of sailors may manifest themselves in unequivocal signs, and which demand punishment from the consequences which they produce, although the facts cannot be established in evidence. Is the power of personal chastisement that the law

allows the master to inflict upon insubordinate sailors, and which is so repugnant to the feelings of many of our citizens, expedient and right? We maintain that it is! because it is clear that such or like means are essential to the safety of the voyage, and without them no whaling voyages could be safely prosecuted. Suppose recreant offenders could only be placed in irons until the ship arrived in port, or within the jurisdiction of a competent court to try the case? Under these circumstances their services would be lost; and were a sufficient number to merit this punishment, it would be in their power at any time to break up a voyage, by placing themselves in this position. Personal chastisement of sailors, we say then, is just, from the necessity of the case. It should never, however, be inflicted but on sure grounds, and with proper weapons. Should the master of the ship fail to comply with the requisitions of the law in this respect, he is, and ought to be, amenable to the injured party in damages, as is fully proved by the records of our courts. His position, with a crew possessing the physical power to wrest from him his command, at all times subject to revolt, and far away from succour, on the desert of the ocean, is unenviable. If his responsibilities are great, so also should be his rewards, if he meets these responsibilities with promptitude, and performs his duty."—*Hunt's Magazine*.

On the departure of a whale ship from an American port, the provisions and other stores are stowed away, and arranged in the order to be required for future use. The crew have packed in their chests their best apparel, and all they do not immediately require, and they appear in their red shirts and new tarpaulins. The instruments which have been prepared are carefully stowed away in their cases, and the whaleboats are swung in regular order, above the deck or on the ship's side; the crew are mustered on board, and the ship departs for a long and uncertain voyage.

The following accounts of an actual disaster and voyage, extracted from a recent number of the *New York Merchants' Magazine*, will best elucidate the dangers attendant upon the whale fishery.

"The ship *Essex*, Captain George Pollard, sailed from Nantucket, 12th of 8th month, 1819, on a whaling voyage to the Pacific Ocean. Her crew consisted of twenty-one men, fourteen of whom were whites, mostly belonging to Nantucket; the remainder were blacks. On the 20th of the 11th month, 1820, in latitude 0 deg. 40 min. south, longitude 119 deg. west, a school of whales was discovered, and, in pursuing them, the mate's boat was stove, which obliged him to return to the ship, when they commenced repairing the damage. The captain and second mate were left with their boats, pursuing the whales. During this interval the mate discovered a large spermaceti whale near the ship; but not suspecting the approach of any danger, it gave them no alarm until they saw the whale coming with full speed towards them. In a moment, they were astonished by a tremendous crash. The whale had struck the ship a little forward of the fore chains. It was some minutes before the crew could recover from their astonishment, so far as to examine whether any damage had been sustained. They then tried their pumps, and found that the ship was sinking. A signal was immediately set for the boats. The whale now appeared again making for the ship; and, coming with great velocity, with the water foaming around him, he struck the ship a second blow, which nearly stove in her bows. There was now no hope of saving the ship, and the only course to be pursued was, to prepare to leave her with all possible haste. They collected a few things, hove them into the boat, and shoved off. The ship immediately fell upon one side, and sunk to the water's edge. When the captain's and second mate's boats arrived, such was the consternation, that for some time not a word was spoken. The danger of their situation at length aroused them, as from a terrific dream to a no less terrific reality. They remained by the wreck two or three days, in which time they cut away the masts, which caused her to right a little. Holes were then cut in the deck, by which means they obtained about 600 pounds of bread, and as much water as they could take, besides other articles likely to be of use to them. On the 22nd of the 11th month, they left the ship, with as gloomy a prospect before them as can well be imagined. The nearest land was about 1000 miles to the windward of them; they were in open boats, weak and leaky, with a very small pittance of bread and water for the support of so many men, during the time they must necessarily be at sea. Sails had been prepared for the boats, before leaving the ship, which proved of material benefit. They steered southerly

by the wind, hoping to fall in with some ship, but in this they were disappointed. After being in their boats twenty-eight days, experiencing many sufferings by gales of wind, want of water, and scanty provisions, they arrived at Ducie's Island, in latitude 24 deg. 40 min. south, longitude 124 deg. 40 min. west, where they were disappointed in not finding a sufficiency of any kind of food for so large a company to subsist on. Their boats being very weak and leaky, they were hauled on shore and repaired. They found a gentle spring of fresh water, flowing out of a rock at about half ebb of the tide, from which they filled their kegs. Three of the men chose to stay on the island, and take their chance for some vessel to take them off."

The following is another account from the same authority.

"In the afternoon of a day which had been rather stormy, while we were fishing in the North Pacific, 'a school' of young bull whales made their appearance close to the ship, and as the weather had cleared up a little, the captain immediately ordered the mate to lower his boat, while he did the same with his own, in order to go in pursuit of them.

"The two boats were instantly lowered, for we were unable to send more, having two others 'stove' the day before; they soon got near the whales, but were unfortunately seen by them before they could get near enough to dart the harpoon with any chance of success, and the consequence was, that the 'pod' of whales separated, and went off with great swiftness in different directions. One, however, after making several turns, came, at length, right towards the captain's boat, which he observing, waited in silence for his approach without moving an oar, so that the 'young bull' came close to his boat, and received the blow of the harpoon some distance behind his 'hump,' which I saw enter his flesh myself, as it occurred close to the ship. The whale appeared quite terror-struck for a few seconds, and then suddenly recovering itself, darted off like the wind, and spun the boat so quickly round, when the tug came upon the line, that she was within a miracle of being upset. But away they went, 'dead to windward,' at the rate of twelve or fifteen miles an hour, right against a 'head sea,' which flew against and over the bows of the boat with uncommon force, so that she, at times, appeared ploughing through it, making a high bank of surf on each side. The second mate, having observed the course of the whale and boat, managed to waylay them, and when they came near to him, which they speedily did, a 'short warp' was thrown, and both boats were soon towed at nearly the same rate as the captain's boat had been before.

"I now saw the captain darting the lance at the whale as it almost flew along, but he did not seem to do so with any kind of effect, as the speed of the whale did not appear in the least diminished, and in a very short time they all disappeared together, being at too great a distance to be seen with the naked eye from the deck. I now ran aloft, and, with the aid of a telescope, could just discern from the mast-head the three objects, like specks upon the surface of the ocean, at an alarming distance. I could just observe the two boats, with the whale's head occasionally darting out before them, with a good deal of 'white water' or foam about them, which convinced me that the whale was still running. I watched them with the glass until I could no longer trace them, even in the most indistinct manner, and I then called to those on deck, that they might take the bearing, by compass, of the direction in which I had lost sight of them, that we might continue to 'beat' the ship up to that quarter.

"Although all eyes were employed, in every direction, searching for the boats, no vestige of them could be seen; and, therefore, when half-past nine, P. M., came, we made up our minds that they were all lost; and, as the wind howled hoarsely through the rigging, and the waves beat savagely against our ship, some of us imagined that they could occasionally hear the captain's voice, ordering the ship to 'bear up,' while the boats had been seen more than fifty times by anxious spirits, who had strained their eyes through the gloom until fancy robbed them of their true speculation, and left her phantasmagoria in exchange. We all looked in that direction, and in a few minutes we could plainly perceive it; in a short time we were close up with it, when, to our great joy, we found the captain and all the men in the boats, lying to leeward of the dead whale, which had, in some measure, saved them from the violence of the sea. They had only just been able to procure a light, having unfortunately upset all their tinder through the violent motion of the boats, by which it became wet, but which they succeeded in igniting after immense application of the flint

and steel; or their lantern would have been suspended from an oar directly after sunset, which is the usual practice when boats are placed under such circumstances."

"On the morning of the 18th of June, 1832, while we were still fishing in the 'off-shore ground' of Japan, we fell in with an immense sperm whale, which happened to be just the sort of one we required to complete our cargo. Three boats were immediately lowered to give him chase; but the whale, from some cause or other, appeared wild in its actions long before it had seen any of our boats, although it might have been chased the day before by some other ship. It was greatly different in its actions to most other large whales, because it never went steadily upon one course. If he 'peaked his flukes,' or went down going to the southward, we expected he would continue that course under water, but when he again rose, perhaps he was two or three miles away from the boats to the northward; in this sort of manner he dodged us about until near four, P.M., at which time the men were dreadfully exhausted from their exertions in the chase, which had been conducted under a broiling sun, with the thermometer standing in the shade at 93 deg. About half-past four, however, the captain contrived, by the most subtle management and great physical exertions, to get near to the monster, when he immediately struck him with the harpoon with his own hands; and, before he had time to recover from the blow, he managed, with his usual dexterity, to give him two fatal wounds with the lance, which caused the blood to flow from the blow hole in abundance. The whale, after the last lance, immediately descended below the surface, and the captain felt certain that he was going to 'sound,' but in this he was much mistaken; for, a few minutes after his descent, he again rose to the surface with great velocity, and, striking the boat with the front part of his head, threw it high into the air, with the men and every thing contained therein, fracturing it to atoms, and scattering its crew widely about. While the men were endeavouring to save themselves from drowning, by clinging to their oars and pieces of the wreck of the boat, the enormous animal was seen swimming round and round them, appearing as if meditating an attack with his flukes, which, if he had thought proper to do, in return for the grievous wounds that he had himself received, a few strokes of his ponderous tail would soon have destroyed his enemies; but this was not attempted. They had now nothing to hope for but the arrival of the other boats to relieve them from their dangerous situation, rendered more so by the appearance of several large sharks, attracted by the blood which flowed from the whale, which were sometimes only a few feet from them; and also from the inability of one of the boat's crew to swim, by which three or four of his mates were much exhausted in their efforts to save him, which they succeeded in doing, after having lashed two or three oars across the stern of the boat, which happened to be not much fractured, on which they placed their helpless fellow-adventurer. After they had remained in the water about three-quarters of an hour, assisting themselves by clinging to pieces of the wreck, one of the other boats arrived and took them in. But although these brave whale fishermen had been so defeated, they were not subdued; the moment they entered the boat which took them from the ocean, their immediate determination was for another attack upon the immense creature, which remained close by, while the other boat, which was pulling towards them with all the strength of its rowers, would still be a quarter of an hour before it could arrive.

"The captain, with twelve men in one boat, therefore, made another attack upon the whale with the lance, which caused it to throw up blood from the blow hole in increased quantities. We, who were on board the ship, and had observed from a great distance, by means of the telescope, the whole of the occurrence, were employed in beating the ship towards them; but they were far to windward, and, the wind being rather light, we had even our royal sails set. Soon after the arrival of the third boat, the whale went into its flurry and soon died, when, to the dismay of the boats' crews, who had endured so much danger and hardship in its capture, it sunk, and never rose again—an occurrence which is not very unfrequent, owing, of course, to the greater specific gravity of the individual, perhaps from a greater development of bony and muscular structures. Such were the adventures of that day, in the evening of which the crews returned to the ship, worn out and dispirited, having lost a favourite boat, with the whole of her instruments, besides the last whale wanted to complete the cargo, and worth at least 500*l*!"

When a whale is dead, the process of extracting the oil commences, by two opera-

tions, called "cutting in" and the "trying out." The whale is brought alongside of the ship, and the business of *cutting in*, by means of the spades, is effected. A man descends upon the floating carcase, and cutting a hole in the body of the whale, near its junction with the head, inserts a hook in the hole, by which that part is drawn up towards the ship by pulleys prepared for the purpose. This, particularly in a high sea, is a dangerous experiment, as the motion of the waves prevents certain footing upon the slippery body of the animal. A tension being produced upon the fat by this motion, it is cut by the spade in strips of two or three feet broad, and in a spiral direction, which is done by means of a windlass acting upon pulleys that are fixed to the maintop. The "blanket pieces," as they are termed, are removed by a similar process to that of a bandage unrolled from a circular body; and the animal is divested of its blubber to the flukes, the head being previously cut off and allowed to float, carefully secured, at the stern of the ship.

The carcase of the whale, after being flayed, is allowed to float off; the head is then hoisted on end by the pulleys, the *case* is opened, and the spermaceti is taken out, by means of a pole and bucket which is dipped into the cavity. The junk is then cut from the head. This is hoisted on board, and cut into square pieces, when the head is allowed to sink, being divested of the means of buoyancy. The blanket pieces, from eight to fourteen inches thick, are then cut from the long strips of fat, and, as well as the junk, are separated into thin pieces, upon blocks called horses, and thrown into the *try-pots* in which the blubber is melted. The membranous parts of the oil, which are called "scraps" by the sailors, are used as fuel; and the spermaceti from the *case* is boiled alone, and called "head matter." The oil and spermaceti are then placed in barrels, to be brought back into port.

The whalebone, which forms so important an article of commerce, is in the mouth of the whale, and forms a filter within peculiarly adapted to separate the sea-water from the sepia, or other fish, on which it feeds. The laminae, about 300 in number, are situated on each side of the head, and the longest blade is usually the test which designates the size of the whale. Its greatest length is fifteen feet; its greatest breadth, about twelve inches, and its greatest thickness, about five-tenths of an inch. The edge of each blade of the bone annexed to the tongue, is fringed with a sort of hair; and it is generally brought from Greenland in its natural state, although sometimes prepared for market on ship-board.

It is estimated by Scoresby, that four tuns of blubber produces generally about three tuns of oil, each tun comprising 252 gallons by wine measure. The colossal dimensions of this animal may be adjudged from the fact, that whales are sometimes caught which yield thirty tuns of pure oil, although these are, of course, not as common as those which produce twenty tuns. It has been found that the quantity of oil produced from a single whale, usually bears a uniform proportion to the length of the bone. The following table, prepared by one who has had much experience in the matter, gives the relative proportion which the size of the bone in a whale bears to the quantity of oil, and which is probably as accurate as any information which can be procured from the uncertain means of testing the fact.

Length of whalebone in feet.	1	2	3	4	5	6	7	8	9	10	11	12
Oil yielded in tuns.	1½	2½	2¾	3½	4	5	6½	8½	11	13½	17	21

It is estimated that a whale of sixty feet in length, does not fall short of the weight of seventy-tons, the blubber comprising about thirty tons; the bones of the head, whalebone, fins, and tail, ten, and the carcase nearly thirty-two. The flesh of the young whale is of a red colour, and in consistency it is somewhat like coarse beef, while that of the old whale is exceedingly black, being constituted of firm beds of muscles, which appear to be directed to the movements of the tail, the flesh being thus rendered too coarse to be eaten. These bones, however, are extremely porous, and contain much fine oil.

"The appearance of most whalemén," observes a writer in *Hunt's Magazine*, "when they return from a voyage, is hardy and robust in the extreme; the substantial food and

bracing air, afforded by the circumstances in which they are placed, as well as their violent exercise, serving to give remarkable vigour and animation to their constitutions. The class of men acting in the capacity of masters, and to whom we have before adverted, cannot be regarded with too great respect. As a body, they are men who have combined in their character the most valuable traits; cool, determined, and brave, they bear the weight of duties, and encounter hazards, which could hardly be appreciated upon the land. A striking difference exists, however, in the success of different masters of ships. Some appear always endowed with good luck, and make prosperous voyages, while others are as uniformly unfortunate in their expeditions. Doubtless, the different success of these captains may be attributable to a diversity in skill, energy, knowledge, and prudence; yet it is as often owing to circumstances which are known only to the Omniscient. We have in our eye one of these men, who, although yet comparatively young, is distinguished for his energy and his uniform success in these whaling expeditions. Spare in his form, there is a restlessness in his eye and frame, which seems to indicate that his soul is absorbed in his pursuit, and conquered by his ambition to succeed. Whenever he is enlisted as a master of a ship, that ship is sure to make a good voyage. He has worked his way, by degrees, to the station of principal owner in a large ship, starting as he did, a common sailor, and by his own efforts has already earned a considerable fortune. His course presents an exception to the general custom of whale fishermen, in the fact that he usually takes his wife with him to sea, and we have seen his little dark-eyed boy, with a complexion embrowned by a tropical sun, clothed in a complete suit of seal-skins, which he had procured with his father on one of his already many voyages round the world, in the prosecution of the whale-fishery. This man has been a source of vast profit to his employers, and while we are writing, is probably hurling the harpoon into a whale upon waves so high, and beneath clouds so dark, that other mariners would deem it prudent to lay to for preservation from the winds. He is, however, only one of that numerous class of the whale-fishermen of New England, who have from the time of Burke, within the last half century, earned a reputation which is as wide as the commercial intelligence of the world.

"Nor do these hardy fishermen, although tossed for months upon the watery waste of the ocean, forget the friends whom they have left upon the land. The numerous rows of beautifully enamelled and polished shells of various forms, which line the cabinets of our seaport towns; the ostrich eggs, which the sailors often collect upon the shores of Africa, and bring home as curiosities made into bottles, and brought into port as presents; the canes, cut from the jaw-bone of the whale, of the colour of ivory, and carved with curious devices, evince the ingenuity with which they occupy their leisure time. Nor are the fine arts neglected by these sons of the ocean; for we see the walls of the houses of our whalemen frequently adorned, not disfigured, by well-executed paintings of the whale, in different postures, from the first blow of the harpoon to his last spouting of blood.

"Of late years, as we have seen, the states bordering the Atlantic, including the principal seaport towns of Maine, New Hampshire, Massachusetts, Rhode Island, and Connecticut, and even the more inland states of New Jersey and Delaware, have embarked, to a considerable extent, in the whale fishery; and the luxurious edifices which adorn many of these cities, attest the enterprise of those who are engaged in the traffic, and the success of their labours."—*Merchants' Magazine*, various Sources.

The character of the inhabitants of Nantucket and the seaports from Cape Cod to New London, who follow the whale fishery, is grave, sober, and persevering; and they retain much of the deportment which characterised their ancestors, who were either quakers or puritans. Their ships in this employment, or their whale fleet, are each from 200 tons to 600 tons. With these vessels they navigate the greatest oceans, and most stormy regions. Their voyages average about two years and a half, but they are fitted out for three years; and care is taken to have every article that may be considered necessary to promote the comfort, and preserve the health of the crews.

The preparation for whaling voyages, and the departures of the ships, are attended with the most interesting circumstances. The mothers, wives, sisters, or daughters, of these hardy and adventurous men, are, long before the day of sailing, busily engaged in collecting every delicacy for the voyage, and providing and packing up all sorts of clothing suitable for the stormy and cold rigours of the Antarctic regions, as well as for the mild climate and gentle seas of the Pacific. On parting with them for a period of nearly, or more than three years, the old, middle-aged, and young, of both sexes, manifest in the most tender and affectionate manner, all the endearing feelings of the heart.

Some of these ships proceed round Cape Horn, others round the Cape of Good Hope, and they frequently meet in the Pacific. The Indian, Chinese, and Pacific Oceans, are better known to these men than to any other navigators; and to this circumstance, and their great caution in keeping two men always stationed at the mast head, on the look out for land or breakers, must be attributed the very few shipwrecks among them—for they certainly navigate the most boisterous regions, and the most imperfectly known seas, especially on the charts, in the world. The dangers to which they are exposed are great in the extreme, and innumerable are the hazards they encounter.

The whales most valued are considered as becoming scarcer, and ships are going farther south than before; and those engaged in the South Sea seal fishery proceed still farther than the whalers towards the South Pole. The ships seldom remain more than three months at a time over each whaling ground.

During these long voyages, the young men receive instructions, from those older, in mathematics, navigation, geography, the natural history of the South Seas, and in practical knowledge connected with their hazardous profession. They occasionally land and refresh themselves in some of the beautiful islands of the Pacific, and return on shipboard invigorated and recruited, to follow their proper pursuits.

LAW RELATIVE TO AMERICAN VESSELS ENGAGED IN THE WHALE FISHERY.

•The following law, to cancel the bonds given to receive duties upon vessels and their cargoes, employed in the whale fishery, and to make registers lawful papers for such vessels, was passed by the present Congress of the United States, and approved by the President, April 4th, 1840 :—

1. That all vessels which have cleared, or hereafter may clear, with registers, for the purpose of engaging in the whale fishery, shall be deemed to have lawful and sufficient papers for such voyage, securing the privileges and rights of registered vessels, and the privileges and exemptions of vessels enrolled and licensed for like voyages, shall have the same privileges and measure of protection as if they had sailed with registers, if such voyages are completed, or until they are completed.

2. That all the provisions of the first section of the act, entitled “An act supplementary to the act concerning consuls and vice-consuls, and for the further protection of American seamen,” passed on the 28th day of February, Anno Domini eighteen hundred and three, shall hereafter apply and be in full force as to vessels enrolled and licensed for the fisheries, and all vessels which have been engaged in the whale fishery, in the same manner and to the same extent as the same is now in force and applies to vessels bound on a foreign voyage.

3. That all forfeitures, fees, duties, and charges of every description, required of the crew of such vessels, or assessed upon the vessels or cargoes, being the produce of such fishery, because of a supposed insufficiency of a register to exempt them from such claims, are hereby remitted; and all bonds given for such cause are hereby cancelled, and the secretary of the treasury is hereby required to refund all such monies as have been, or which may be paid into the treasury, to the rightful claimant, out of the revenues in his hands.

CHAPTER X.

BRITISH WHALE FISHERY.

THE British whale fishery, formerly so very extensive, has, from causes which have developed their effects during the last ten years, declined rapidly; and there is every probability that both the northern and southern British whale fishery will be discontinued from the ports of the United Kingdom. The substitution of vegetable and lard oils, and stearine from lard—the great outlay of capital in the southern whale fishery, the long period which must expire before any return can be realised for the expenditure, constitute the chief causes of the decline of the whale fishery from British ports. The Dutch whale fishery disappeared in the early part of the present century; the French whale fishery is only maintained by bounties taken from the national taxes, and we can scarcely hope that it can ever be revived so as to constitute a profitable pursuit from any port in Europe. If it should be carried on to any advantage by the Americans, we do not see why it should not be conducted with equal profit from the ports of Nova Scotia and New Brunswick. We doubt, however, whether this expensive and perilous fishery can be continued for many years, with profit, from any of the Atlantic states. The rapidly increasing use of much cheaper and equally efficient substitutes for sperm oil and spermaceti, as well as for common whale oil, must cause a corresponding decrease in the price of other oils for the same uses; and unless they can be supplied with some profit at those reduced prices, they will cease to be produced. New Zealand, New South Wales, and Australia, are all conveniently situated for the whale fishery; and it appears to us that if the whale fishery is to be hereafter carried on with success and profit, it must be from establishments for the purpose, in those colonies, and in the islands of the Pacific. One great impediment to the continuance of the southern whale fishery is the heavy outlay of capital: and private individuals will hesitate before they invest, probably, all they possess in one great risk. Whether a company could safely enter upon a project which would employ a great number of ships, improve our naval architecture, and under a judiciously regulated system, elevate the moral character of seamen, and extend the scientific acquirements, and the requisite qualification for commanders, or shipmasters, is a question to be solved only by those who have the most practical knowledge of the subject.

STATEMENT of the Southern Whale Fishery carried on from Great Britain since 1800; exhibiting the Total Number of Ships annually absent from Great Britain on Whaling Expeditions; the Total Number of Ships that annually returned to Great Britain; the Annual Imports of Sperm and Common Oil, with the Prices of each; the Average Tonnage of the Ships at Sea; and the Average Number of Men to each Ship.

The foregoing table shows a falling off in twenty years of 237 ships, and 9780 men, employed in the British fisheries, being equal to $\frac{1}{10}$, which is asserted to be attributable to the withdrawal of bounties from *British* fisheries, and the abatement of duties on vegetable oils, the produce of *Foreign* Countries, the increased importation of the latter being shown in the following table.

VEGETABLE Oils imported into the United Kingdom in the respective Years 1821, 1841, 1842, 1843, and 1844.

DESCRIPTION OF OIL.	1821		1841		1842		1843		1844

There are no accounts existing, that we know of, from which we can ascertain the bounties paid from 1789 to 1813 inclusive: as those in the customs were destroyed by fire. The bounties paid, according to M'Pherson, from 1750 to 1788 amounted to 1,577,935*l.* sterling; and Mr. M'Culloch estimates that more than 1,000,000*l.* has been paid after that period. So that more than 2,500,000*l.* sterling have been paid by the nation for bounties to the whale fishery.

The northern whale fishery, though for a long period, a severe and perilous nursery for hardy and daring seamen, appears to have been always a speculation and most uncertain pursuit. Its gradual decline, and the probability of its total extinction are shown in the following tables. All pursuits will cease to be followed when they become unprofitable,—when repeated losses are the result. We may lament over the extinction of fleets sailing annually on certain expeditions, which, from long continuance, we, very naturally, considered, as for all time to be allied to the past, the present, and the future maritime history of our country. The fleets of the East India Company,—a glorious and majestic naval force, have vanished. The trade with India has not diminished. Our merchant princes, send thither their individual fleets, which rival those of the Company. We would rejoice at the continuance and the extensive increase of the British South Sea whale fishery as a bold maritime enterprise. Can this be carried into effect for the general benefit of the nation? This is a question which we cannot undertake to answer.

Mr. Charles Enderby, who, and his predecessors, have been extensively engaged in the whale fishery, and to whom we have to acknowledge our obligation for many of the elements of the foregoing tables, states in the last communication which he has favoured us with, that the number of ships engaged in the northern and southern whale fisheries, during the years 1843 and 1844, were as follows, viz. :—

YEARS.	NORTHERN FISHERY.	YEARS.	SOUTHERN FISHERY.
	Ships.		Ships at Sea.
	number.		number.
1843.....	24	1843 Christmas.....	50
1844.....	32	1844.....	47
1845.....	34*	1845 30th of April.....	44

* The supposed number likely to be equipped.

He considers that fifteen ships will, probably, return to England from the southern fishery this year ; of this number, it is not probable that more than five will be refitted.

Twenty-one ships are engaged in the southern fisheries from the Australian colonies. Six ships from St. John's, New Brunswick ; and one ship from Halifax, Nova Scotia.

From the United States of America, 1st of April, 1845, 691 ships.

CHAPTER XI.

MANUFACTURES OF THE UNITED STATES.

INDUSTRY, exhibiting the unsubdued spirit of perseverance, while enduring the greatest privations in opposition to, and in overcoming all the difficulties peculiar to, an unknown wilderness and uncivilised aborigines, has, from the first settlement of the New England colonies, characterised the Anglo-Saxons; who fled to America, in order to enjoy civil liberty, and the freedom of worshipping the Creator, according to their conscientious belief, in the truth, purity, and simplicity of primitive Christianity.

The Anglo-Saxons who first emigrated were nearly all poor families. Their means of subsistence depended upon subduing the forest, cultivating the soil, killing wild animals and wild fowl, and upon catching the fish which frequented the shores and rivers. Horned cattle and other live stock were gradually introduced from Europe. But, while in England, persecution continued against those unfortunate persons, emigrants arrived in America faster, and the population increased faster than cattle. Afterwards the latter multiplied rapidly, and it is curious, that as the price of cattle fell from 25*l.* a head, as stated by the Honourable Edward Everett, in an address delivered before the American Institute at New York:—"The effect of which," he observed, "was distressing, but it put the sagacious colonists upon new resources. The account of this, contained in the early historian of the colony, is strongly characterised by the simplicity of elder times." After describing the check put to emigration, he goes on as follows:—"Now the country of New England was to seek of a way to provide themselves with clothing, which they could not obtain by selling cattle, as before; which now were fallen from that huge price forementioned, first to 14*l.* sterling and 10*l.* sterling a head, and presently after, at best within the year, to 5*l.* sterling a piece; nor was there at that rate, a ready vent for them neither. Thus the flood which brought in much wealth to many persons, the contrary ebb carried all away out of their reach. To help them in this their exigent, besides the industry that the present necessity put particular persons upon, for the necessary supply of themselves and their families, *the general court made order for the manufacture of woollen and linen cloth*, which, with God's blessing upon man's endeavour, in a little time stopped this gap in part, and soon after another door was opened by special Providence. For when one hand was shut by way of supply from England, another was opened, by way of traffic, first to the West Indies and Wine islands, whereby among other goods, much *cotton wool* was brought into the country from the Indies, which the inhabitants learning to spin, and breeding of sheep and sowing of hemp and flax, they soon found out a way to supply themselves of [cotton] linen, and woollen cloth."

This early account of the commencement of manufactures in the Anglo-American colonies was followed in nearly all the others, and there is scarcely a

farmer in the northern, central, and western states, and in the British North American colonies, in whose farm-houses the common articles of wearing apparel are not made, chiefly of linen, wool, and cotton.

The following extract from an article in the *Merchants' Magazine* is interestingly characteristic of the industrious energy of the early settlers, and their progress in America:—

“The Anglo-American colonists were, for the most part, poor men, without high rank or title, who were obliged to hew out their own way. Some, it is well known, were induced to immigrate from religious motives, and others from motives of gain, but in all we see traits which are not to be mistaken—the iron firmness and downright vigour of the Anglo-Saxon. They came to a country in which a throne had never stood, without any invincible prejudices in favour of prescriptive principles and forms. They planted themselves in forests fresh in the magnificence of nature, and burdened with the resources of national wealth; and it was this very Anglo-Saxon spirit which enabled them to contend successfully, first with France, and then with England, in two long and bloody contests, and to come out victors, securing to themselves the possession of the soil. It was the spirit of the Anglo-Saxon which afterwards embodied itself in the constitution of the United States, through which they have quadrupled their effective power. It is this which has given increased momentum to the productive industry of the country, which places the great bulk of the people on a broad platform of equal rights, and has made them the source of law, in war soldiers, in peace submissive citizens, pressing motives upon their minds, the strongest which can actuate ambitious men—a fair and open field—to secure the greatest good. It burdens the people with no taxes for the support of an ecclesiastical establishment from whose faith they dissent. It gives no money of the treasury to the maintenance of a gigantic civil list, to the purchase of gems which are to blaze before titled rank only, and no part of the soil is granted out to pets as a reward for imaginary services. Throwing aside all those incumbrances which might obstruct free industry, it says, in effect, to the people, ‘Come, draw your nutriment from the ample bosom of your mother earth, and develop the resources of your country, for your country is your commonwealth.’”

The commerce which was carried on, in America, for nearly a century, both by the French and English, was confined to the exchange of European articles for the furs of wild animals, and to the fisheries on the coast. The policy of Great Britain was afterwards perseveringly directed against the manufacturing industry of the colonists. As early as 1731, the jealousy which existed on this subject induced the House of Commons to report with respect to “any laws made, manufactures set up, or trade carried on, in the colonies, detrimental to the trade, navigation, and manufactures of Great Britain;” and, in consequence of an *alarming* discovery in respect to the manufacturing of hats, it was ordained that no hats or felts should be exported from the colonies, or “loaded on a horse, cart, or other carriage, for transportation from one plantation to another.” In 1750, another law was passed, equally degrading. It prohibited the “erection or continuance of any mill or other engine for slitting or rolling iron, or any plating forge to work with a tilt hammer, or any furnace for making steel, in the colonies, under penalty of 200*l*.”

In 1699, an act of the English Parliament declared, that “no wool, woollen yarn, or woollen manufactures of their American plantations should be shipped there, or even laden, in order to be transported from thence to any place whatever.” In 1719, the House of Commons enacted, “that erecting any manufactories in the colonies tended to lessen their dependence upon Great Britain.” Accounts were received by the mother country about the same time—

“That the colonists were not only carrying on trade, but also setting up manufactures detrimental to Great Britain; and, in consequence of these reports, an order was issued by the House of Commons requiring the Board of Trade to report with respect to *laws made, manufactures set up, or trade carried on detrimental to the trade, navigation, or manufactures of Great Britain.*” The

report made by the Board of Trade in 1732, which although probably not accurate, contains the best account of the condition of American manufactures at that period. This report stated that a law had been passed in the colony of Massachusetts bay to encourage the manufacture of paper, which act tended to diminish the profits made by the British importer of that article; that in New England, New York, Connecticut, Rhode Island, and Pennsylvania, woollen and linen cloth were manufactured to some extent for domestic use, and that the product of those colonies being chiefly cattle and grain, with a quantity of sheep, the wool would be lost were it not used for that purpose. It was also reported, that flax and hemp were produced in the colonies to a considerable extent, which were manufactured into a coarse sort of cloth, as well as bags, traces, and halters for their horses, that were more serviceable than those that were imported from abroad; yet, from the high price of labour here, the manufacture of linen could not be carried on at less than twenty per cent, and that of woollens than at fifty per cent less than the costs of the English fabrics. The returns from the English governor of New Hampshire alleged that there were no manufactures in that province, excepting a little linen made by its emigrants from Ireland, but that the principal trade was in lumber and fish. Massachusetts, at that time, also manufactured a coarse cloth from their flax and wool, but the merchants could import the foreign fabrics at a cheaper rate than they could purchase those which were made at home. A few hat-makers worked at their trades in the towns of that state, but none of their articles were exported. The leather of this province was also wrought by the people; and although iron was worked to some extent, it was deemed inferior to that which was imported from Great Britain, this being considered much the best, as it was wholly used in shipping. The same report stated, that all the iron works within its bounds did not make one-twentieth part of the amount required for its consumption. Nor did New York at that time exhibit the degree of manufacturing enterprise which was deemed detrimental to Great Britain—provisions, furs, whalebone, pitch, oil, and tar, constituting the principal portion of its trade. That of New Jersey was no more formidable in this respect, as its traffic consisted of necessary articles shipped from Pennsylvania and New York. To these articles may be added, a little linen and cotton cloth, brown holland, 'for women's wear,' a paper-mill, that manufactured to the amount of 200*l.* yearly, in the province of Massachusetts bay, besides six furnaces and nineteen forges for making iron, that had been constructed in New England. In Rhode Island there were no manufactures returned; and the province of Connecticut produced timber and boards, all sorts of English grain, hemp, flax, sheep, black cattle, and swine, goats, horses, and tobacco. The manufactures in this colony were inconsiderable, the greater portion of the people being engaged in tillage, while others were employed in the various handicrafts, such as tanning and shoemaking, in building, joining, tailors' and smiths' work. At this period the colony of New York was enabled to pay for the foreign fabrics imported from Great Britain, by being permitted to exchange their provisions, and those of New Jersey, as also horses and lumber, with the foreign colonies, for money, rum, molasses, cocoa, indigo, cotton, and wool. Horses and lumber were exported from Connecticut in return for sugar, molasses, salt, and ardent spirits. In Pennsylvania, brigatines and small sloops were built, which they sold to the West Indies, and 'the surveyor-general of his majesty's woods' states, that in the province of New England many ships were built for the French and Spaniards in exchange for rum, molasses, wines, and silks, which 'they truck there by contrivance.'—*Report of Board of Trade.*

Such was the condition of American manufactures in 1732; and the policy which was persevered in towards the plantations, by recommendation of the Board of Trade, was, "to give these colonies proper encouragement for turning their industry to such manufactures and products as might be of service to Great Britain, and more particularly to the production of all kinds of naval stores."

Acts were, accordingly, passed by the British parliament, in order to prevent the progress of colonial manufactures; and, from the information which had been received, *that hats were made to a considerable extent in these colonies, it was provided, by statute passed in 1732, that no hats should be exported; the same act limiting the number of apprentices who were to be engaged in this business, and prohibiting the exportation of hats from one British plantation to another, as well as the manufacture of hats, excepting by those who had served an apprenticeship of seven years, and forbidding any black or negro from making hats at all.* The manufacturer of iron was also regarded with equal jealousy; and, although the colonies were permitted, by a law that was enacted in 1750, to im-

port pig and bar iron into Great Britain free of duty, its object was to monopolise its *manufacture*. All factories in the colonies were deemed “a common nuisance, and were required to be abated within thirty days after the evidence of their existence should be adduced, under a penalty of 500*l*.” These acts were justly deemed by the colonists usurpations of their right: “for why,” said they, “ought not the manufacturers of this country have been permitted the same privileges as the same classes in England?”

“Among the most just causes of complaints in the British colonies against the British government were the restrictions which discouraged manufactures. To prevent a whole people from following any branch of industry is assuredly a measure which human nature cannot bear with tame submission: nor can the severity of the regulation be denied, even on the ground that the articles prohibited could be imported cheaper from England. The injury felt by the prohibition was not at the time of much consequence; but the regulation was in itself considered an insult to the understanding of the colonists far more intolerable than previous oppression.”*

During the war of the revolution, the Americans continued and increased their manufactures, of *home-made woven cloth*: that is, woollen cloths, linens, &c., spun, woven, dyed, or bleached, on the premises of the farmers, and of the other inhabitants. This has from an early period been, and has continued to be, the case in all the North American settlements; in which the colonists have also, as far as possible, made their axes, common tools, agricultural instruments, and various articles necessary for their use.

From the peace of 1783 to 1791, some attempts were made to establish, on a larger scale, new manufactures, but generally without success.

Mr. Pitkin, who deserves great praise for his labours, but whose mind was not sufficiently clear, nor his judgment so expansive or sound, as to understand the delusive fallacy of the protective system, observes—

“One of the objects which claimed the attention of the first Congress, under the new form of government, was the encouragement and protection of the manufacturing, as well as the commercial interests of the country. In laying duties on imports in July, 1789, Congress had reference, as the preamble of the act, imposing them, declares, to ‘the encouragement and protection of manufactures.’ This was, also, openly avowed, on the floor of the House of Representatives, in the debates on the first tariff, established by the general government.

“The first secretary of the treasury (Hamilton), whose powerful mind seemed intuitively, fully to comprehend every subject, to which it bent its force, was the great advocate of American manufactures.

“In his celebrated report on this subject, presented to the House of Representatives, in January, 1791, every argument was urged, and we may truly add, exhausted, in favour of the policy and expediency of protecting and encouraging this branch of domestic economy.”

The fallacious system of protective duties was immediately after introduced.—
(See Commercial Legislation of the United States hereafter.)

“Some branches of domestic manufacture had, at that time, made such progress, as in a great measure to supply the home market. Among these the secretary mentions those of skins and leather, iron, wood, flax and hemp, bricks, coarse tiles and potters’ ware, ardent spirits and malt liquors, writing and printing paper, sheathing and wrapping paper, press paper and paper hangings, hats, women’s stuff and silk shoes, refined sugar, oils of animals and seeds, soap, spermaceti and tallow candles, copper and brass wares, particularly for distilleries, sugar refiners, and brewers, andirons and other utensils for household use, philosophical apparatus, tin wares for most purposes of ordinary use, carriages of all kinds, snuff, chewing, and smoking tobacco, lamp black, and other painter’s colours, and gunpowder. These articles were made in manufactories, by the way of regular trades. In addition to these, great quantities of cloths of wool, cotton, and flax, or mixtures of them, were made in families, in every part of the country; and to such extent, as

* Macgregor’s British America, 2nd ed., vol. i., p. 17, *et seq*.

the secretary says, in some districts, as to supply two-thirds, three-fourths, and even four-fifths of the clothing of the inhabitants.*

It appears that in 1791, when Mr. Hamilton drew up his report, establishments for the manufacture of cotton and wool had commenced in Rhode Island, Massachusetts, and Connecticut; and a company with 500,000 capital, had been formed, for a cotton establishment at Patterson, in New Jersey, and afterwards commenced business at that place. The first cotton factory in the United States, was established at Providence, by Almy and Brown, and Mr. Samuel Slater, a cotton manufacturer from England.—(See Cotton Manufactures hereafter.)

A cotton manufactory was established at Beverley, in Massachusetts, in 1789 or 1790, by a number of residents in that town, who were aided by the legislature of Massachusetts. Washington appeared, on delivering his message to Congress, in a suit of cloth manufactured in this factory presented to him by its owners. The articles then made in these establishments, were principally corduroys, fustians, and jeans. About the same time, a woollen factory was established at Hartford, in Connecticut.—*Pitkin's Statistics*.

Returns were, in 1810, prepared by order of the federal government of the manufactures of the union.

The returns from Pennsylvania, Connecticut, Massachusetts, New York, and Virginia were considered the most perfect, though in many respects defective. From these returns, an estimate, or digest, of the value of the manufactures of the United States at that period, 1810, was made by Mr. Tench Coxe, selected for that purpose by the secretary of the treasury, and was as follows:—

	dollars.		dollars.
1. Goods manufactured by the loom, from cotton, wool, hemp, flax, and silk, including stockings	39,497,057	11. Manufactures from grain, fruit, and case liquors, distilled and fermented	16,528,206
2. Other goods spun from the fine materials above enumerated	2,052,120	12. Dry manufactures from grain, exclusive of flour, meal, &c.	75,767
3. Instruments and machinery manufactured, estimated at 186,000 dollars, carding, fulling, and floor-cloth staining by machinery, estimated at 5,957,816 dollars	6,144,446	13. Manufactures of wood	5,554,708
4. Hats of wool, fur, &c. and from mixtures thereof	4,328,744	14. " of essences of oils	179,150
5. Manufactures of iron	14,364,526	15. Refined sugar	1,415,724
6. " of gold, silver, set-work, mixed metals, &c.	2,483,912	16. Manufactures of paper, paste boards, cards, &c.	1,939,285
7. " of lead	325,560	17. " of glass	1,047,004
8. Soap, tallow, candles and wax, spermaceti, and whale oil	1,766,292	18. " of marble, stone, and slate ..	462,115
9. Manufactures of hides and skins	17,935,477	19. Earthen manufactures	259,720
10. " from seeds	858,589	20. Tobacco	1,260,378
		21. Drugs, dye-stuffs, and dyeing	500,382
		22. Cables and cordage	4,243,168
		23. Manufactures of hair	129,731
		24. Various and miscellaneous manufactures ..	4,347,611
		Total	127,694,602

The spinning, and dyeing, and weaving of cotton and wool were then principally confined to the houses of the farmers and other inhabitants. In which way Mr. Gallatin considered that about two-thirds of the clothing (including

* The *Lowell Courier* contains a letter from Mr. Louis M. Norton, of Goshen, Connecticut, to Mr. Samuel Lawrence, of Boston, which gives the history of one of the first, if not quite the first, systematic effort to manufacture woollens upon an extended scale. "This occurred in 1813—14, and looks strangely in comparison with things in 1843. Three men, of whom Mr. Norton was one, put together a capital of 6000 dollars, and established a factory in Goshen, which cost over 3000 dollars. Wool cost 1 dollar 50 cents per lb., and badly made broadcloths brought from 8 dollars 40 cents to 12 dollars per yard. One invoice of 178½ yards brought a total of 1769 dollars 33 cents. Another invoice of 255 yards brought 2551 dollars 15 cents, or more than 10 dollars a yard. Such cloths, if they would sell at all now, would bring about one dollar a yard. But, as it was, the war came to an end—a deluge of English cloths overwhelmed the little Yankee factory, and the partners settled up with the loss of the capital, and three times as much more. Such is an outline of the first essay, or one of the first, at making broadcloths in this country, and the losses were hardly an apology for the hundreds of thousands which have been lost since; through all of which, however, the Yankees have gone on undaunted, until, in many articles, they are now able to defy the skill of the old nations. In those days, merino sheep were the most beautiful animals which walked the earth, and their price was from 1000 to 1500 dollars. He was a great man who owned a sheep, and not a small man who could say that he owned a quarter of one."

hosiery), of the house and table linen worn, and used, by the inhabitants of the United States were made.

The number of cotton mills in 1809 was eighty-seven ; sixty-two of which (forty-eight water and fourteen horse mills) were in operation, and turned 31,000 spindles. The other twenty-five were so far advanced as to be in operation in the course of the year 1810.

Mr. Gallatin estimated the amount of capital employed in the mills at 4,800,000 dollars, the quantity of cotton used 3,600,000 lbs., the yarn spun at 2,880,000 lbs., valued at 3,240,000 dollars, the men employed 500, and the women and boys 3500.

By the return of the marshals, the number of cotton factories was 168, with 90,000 spindles ; but from many of the states no returns were made of the quantity of cotton used, the yarn spun, or the cloth made. Massachusetts had fifty-four, most of them small, having, in the whole, only 19,448 spindles, and spinning 838,348 lbs. of cotton, valued at 931,916 dollars. Rhode Island had twenty-six factories, with 21,030 spindles ; and Connecticut fourteen, with 11,883 spindles.—*Pitkin*, p. 472.

According to the returns of the marshals for 1810, the quantity of cloth made of wool, cotton, and flax, and their mixtures, in each state, with the estimated value, and the number of looms, also, in each state, were as follow:—

STATES.	Yards.	Value.	Looms.	STATES.	Yards.	Value.	Looms.

* By estimate, the value only being returned.

Mr. Pitkin considers that the foregoing quantities and values were short of the truth, as many families were, probably, unable to give very accurate accounts ; and many more, jealous, that the object was taxation, either refused to give any account whatever, or certainly not to the full amount. The marshal of Rhode Island informed the secretary, “ that much patience and forbearance was required by his assistants, from the prejudices of the people, who, in many instances, refused to give any account of their manufactured articles ; and, perhaps, not any article to the full amount or value, from an opinion, that the returns were demanded by government, with a view of taxing their industry.” In consequence of this, the marshal was of opinion, that the articles manufactured might be justly estimated, from twenty to twenty-five per cent above the amount returned ; from which Mr. Pitkin concluded that the value of manufactures of wool, cotton, and flax, in 1810, exceeded 40,000,000 dollars.

The war between the United States and Great Britain, which followed, compelled the Americans to manufacture for themselves: particularly woollen and cotton goods; and many millions of capital were invested in the establishment of woollen and cotton factories.—(See Cotton and Woollen Manufactures hereafter.)

The principal object of the convention, which met at New York, in October, 1831, was, to collect information with respect to particular manufactures; and for this purpose, committees were appointed, composed of persons selected from different parts of the United States.

The attention of these committees was directed to the manufactures of cotton, wool, iron, and steel, salt, hats, cabinet wares, glass, sugar, and molasses, and to the subject of chemistry, as connected with manufactures and the mechanical arts. From these reports and from various official and other documents, the following account of the manufactures of the United States are drawn up.

CHAPTER XII.

RISE AND PROGRESS OF THE COTTON MANUFACTURES OF THE UNITED STATES.

THE efforts of the citizens of the United States to manufacture cotton woven goods, made little progress until some years after the war of the revolution: though, during that war, woven articles had been manufactured for domestic wear.

It was long found impossible, even under the system of protective duties, to compete with the cottons produced by the aid of machinery in England. The genius of Arkwright enabled the latter, in defiance of high taxation and that bane of manufactures, as well as of agriculture, the corn laws, to spin and manufacture cottons for most countries, including the United States. Nor, would the latter have succeeded to the extent to which they have done, in the New England and other states, if England had never imposed high taxes on bread and other food, to make both dear; and if no duty had ever been levied in the United Kingdom, on cotton wool and other raw materials.

We have stated in our description of the several states, the localities, the number, and the value of the products of the cotton, as well as the other manufactures of the United States. Under the head of the Manufactures of Massachusetts, and especially of Lowell, we have given copious details. The following extracts from a pamphlet, written in 1841, by the manager of the Saco cotton mills, in Maine, are worthy of attention; especially as showing how genius and capital is transferred from the United Kingdom to the United States.

“It is to be remembered that Sir Richard Arkwright took his first patent for an entirely new method of spinning cotton yarn for warps in 1769, at which period his first mill was put in operation at Nottingham, in England, and his second mill, which was much larger, was erected at Crom-

ford, Derbyshire, in 1771. After which, his mode of spinning by water-frames extended rapidly all over the kingdom ; so that during the period when the most persevering exertions were being made by various enterprising individuals, in different parts of the United States, to improve and perfect this most important manufacture, England was enjoying all the benefit of Arkwright's patents, by means of which cotton yarn was produced at much less expense and of a superior quality to any that had ever been made by machinery before that period : and, at the same time, the British government were using every means in their power to prevent models or drawings of these machines from being carried out of the country. Every effort to erect or import this machinery into the United States had hitherto proved abortive. Much interest had been excited in Philadelphia, New York, Rhode Island, and Massachusetts, but they found it impossible to compete with the superior machinery of England.

" Such was the state of the cotton manufacture in the United States in 1790 : every endeavour to introduce a proper system of spinning had been fruitless ; and nothing but the introduction of the water-frame spinning, which had superseded the jennies in England, could have laid a foundation for the successful prosecution of the business in America, and that was happily accomplished by one who was personally and practically acquainted with the business in all its details. The individual here referred to was Mr. Samuel Slater, who has justly been called the *Father of the Cotton Manufacture of America*.

" Mr. Slater was born in the town of Belper, Derbyshire, England, on the 9th of June, 1768 ; and when about fourteen years of age, he was bound apprentice, at Milford, near Belper, to Jedediah Strutt, Esq. (the inventor of the Derby ribbed stocking frame, and for several years a partner with Sir Richard Arkwright, in the cotton-spinning business). At that time, Mr. Strutt was erecting a large factory at Milford, where Slater continued to serve him for some time in the capacity of clerk ; but, during the last four or five years of his apprenticeship, his time was solely devoted to the factory, as general overseer, both as respected the making of the machinery, and in the manufacturing department. After having completed the full term of his engagement, viz, six and a half years, he continued for some time longer with Mr. Strutt for the purpose of superintending some new works that were then erecting ; his design in doing so was to perfect his knowledge of the business in every department, as previous to this time his thoughts had been directed to America by various rumours which had reached Derbyshire, of the anxiety of the governments of the different states in that country to introduce and encourage manufactures. A newspaper account of a liberal bounty of 100*l*. having been granted to a person who succeeded in constructing a very imperfect carding machine for making rolls for jennies, and the knowledge that a society to promote manufactures had been authorised by the same legislature, finally determined him to try his fortune in the western hemisphere.

" He embarked at London for New York, on the 13th of September, 1789, and landed at the latter on the 17th of November, after a passage of sixty days. He was, immediately after his arrival, introduced to the New York Manufacturing Company ; but, finding that the state of their works did not suit his views, he left that place in the January following for Providence, Rhode Island, and there made arrangements with Messrs. Almy and Brown to commence preparations for spinning cotton entirely upon his own plan. On the 18th of the same month, the venerable Moses Brown took him out to Pawtucket, *where he commenced making the machinery, principally with his own hands* ; and on the 20th of December, 1790, he started three cards, drawing and roving, together with seventy-two spindles entirely upon the Arkwright principle, being the first of the kind ever operated in this country. These were worked by the water-wheel of an old fulling-mill in a clothier's building, in which place they continued spinning about twenty months, at the expiration of which time several thousand pounds of yarn were on hand, notwithstanding every exertion was used to weave it up and sell it.

" Early in 1793, Almy, Brown, and Slater, built a small mill in the village of Pawtucket, in which they put in operation seventy-two spindles, with the necessary preparation, and to these they gradually and slowly added more and more, as the prospects became more encouraging. After a short time, besides building another factory, they considerably enlarged the first.

" Such, then, were the circumstances under which the Arkwright mode of spinning was introduced into this country, and such was the individual to whom belongs the entirement of its introduction.

" Mr. Slater's business was so prosperous, that about the year 1806, he invited his brother, Mr. John Slater, to come to this country, who, in all probability, brought with him a knowledge of all the most recent improvement made by the English spinners. The now flourishing village of Slatersville, in Smithfield, was then projected, in which John Slater embarked as a partner, and in June of the same year, removed to Smithfield as superintendent of the concern. In the spring of 1807, the works were sufficiently advanced for spinning, and up to the present time, they have been under the management of that gentleman, in an uninterrupted state of improvement. This fine estate was owned, in equal shares, by four partners, but now wholly belongs to John Slater and the heirs of his brother.

" Cotton-spinning, according to the preceding statements, commenced in the then obscure village of Pawtucket in 1790, at which time only seventy-two spindles were put in operation.

"Previous to 1815, the whole weaving in the United States was done by hand-loom, in many of which considerable improvements had been made, and great quantities of cloth were manufactured for home consumption. About 1814, a Mr. Gilmour landed in Boston from Glasgow, with models or patterns of the power-loom and dressing-machine, whom Mr. John Slater invited to Smithfield, and made known to him his wishes to construct these important machines; but not being able to prevail on the whole of the partners to engage in the business, Mr. Gilmour remained some time in Smithfield, employed as a mechanic, where he introduced the hydrostatic press, which proved to be of great advantage in pressing cloth, &c.

"Judge Lyman, of Providence, had been endeavouring to construct a power-loom, but failed in the attempt. On hearing of Mr. Gilmour, he, with some other gentlemen, entered into a contract with him to build a power-loom and dressing-machine, from the patterns he had brought from Great Britain, which he did, to the great satisfaction of his patrons, from whom he received a compensation of 1500 dollars. These machines were soon after introduced into Pawtucket, where David Wilkinson commenced making them for sale. Gilmour was a man of great mechanical genius, but neglected to turn his talents and opportunities to the advantage of his family, and consequently, on his death, they were left in poor circumstances.

"The hand-loom was soon superseded by the others, the introduction of which greatly aided in extending the business in this country, and has enabled the American manufacturers to compete with Great Britain, in South America, India, and some other foreign markets."

The report on cottons, made by the committee of the convention, presents a detailed view of the manufacture of that article in various establishments, in the twelve states of Virginia, Maryland, Maine, Vermont, New Hampshire, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, and Delaware. It appears, that in these twelve states, there were in operation, in 1834, cotton factories to the number of 795, viz.—

Having a capital (in fixtures principally) of dls. 40,614,984	And in these factories there was used
Number spindles in operation was..... 1,246,503	pounds of starch..... 1,641,253
Number of yards of cloth made..... 230,461,900	Barrels of flour for sizing..... 17,245

Pounds of cotton used*..... 77,757,316	Tons of coal..... 24,420
Males employed..... 18,530	Bushels of charcoal..... 9,205
Females employed..... 38,927	Gallons of oil..... 300,338
Children under twelve years..... 4,691	Value of other articles..... dls. 599,223
	That the spindles building were..... 172,024
The annual value..... dls. 26,000,000	Hand-loom..... 4,760
And the annual amount of wages..... do. 10,294,944	And the total of dependents were..... 117,626

In addition to this, the committee, in the same report, estimate the amount of capital employed in shops—

For making machinery, at..... dls. 2,400,000	Annual value..... dls. 1,500,000
The annual value of machinery made, at.... do. 3,500,000	Annual wages, at..... do. 402,963
And the annual wages..... do. 1,248,000	And number of yards printed, at..... 25,000,000
The capital in bleacheries was estimated at.. do. 900,000	Making the annual value of all these establishments..... dls. 32,036,760
The annual product, at..... do. 1,036,760	And the annual amount of wages..... do. 12,155,723
The annual wages, at..... do. 209,814	
The capital employed in printing cottons was estimated at..... do. 1,000,000	

This report including only twelve states, and it remarks that—

"In the southern and western states, no less than thirty establishments have been reported to the committee; but having no accurate returns from these states, they have preferred to omit them altogether. Some reluctance has also been found among the manufacturers in giving all the details required of them. A great proportion of them have mistaken the question respecting the capital which they employ, and returned only that which was invested in fixtures. The committee have not thought it proper to alter the amount so returned; but they will take the opportunity of saying, that so general has been this error, that they have no doubt that one-fourth to one-third, might with propriety be added under this head to the total amount." Cotton factories were at that time in operation in Ohio and Kentucky, and other states.

The foregoing account does not include the cotton manufactured in families, either from the yarn purchased from the factories, or spun in families by machinery made for that purpose.

* Making 214,882 bales, of the average weight of $361\frac{86}{100}$ lbs.

Remarks. Showware includes 162,000 dollars, and Pennsylvania 500,000 dollars, for the capital employing the hand-loom. The cotton consumed, 77,757,316 lbs., is 214,882 bales, of the average weight of 361 86-100 lbs.

It is observed by the manager of the Saco mills, who, we are told, emigrated from the United Kingdom, that the cotton factories of America are chiefly situated in three districts—viz.: first in the eastern, which comprehends Maine, New Hampshire, Vermont, and the eastern part of Massachusetts;—second, the middle district, which includes the western part of Massachusetts, Rhode Island, and Connecticut;—third, that which comprehends New York, New Jersey, Pennsylvania, and a few other places. Lowell, which is the most important in the United States, Waltham, Taunton, Fall River, Springfield, and Three Rivers, are in Massachusetts; Dover, Great Falls, Newmarket, and Nashua, are in New Hampshire; and Saco in Maine. These establishments are possessed by joint-stock companies.

The factories at Providence and its vicinity, including Pawtucket, Smithfield, Lonsdale, Coventry, Cumberland, Cranston, Warwick, Scituate, Johnston, together with Newport, comprehend about eighty mills. Greenville, Cabotville, Williamantic, Norwich, Jewitt's city, and a few others are situated in Connecticut.

Some of these factories in the middle district belong to corporations, but the greater number are the property of private firms or individuals; the machinery is generally old, from these factories having been the first established.

Patterson, in New Jersey, as to the number of factories, is next in importance to Lowell; Matteawan (New York), Manayunk, near Philadelphia, Baltimore, &c. &c., have all cotton factories, and are established, both in respect to machinery and management, as nearly as circumstances allow, after the models of Manchester and Glasgow. In Rhode Island, also, the machinery is almost the same as that used in New York.

The machine manufactories are chiefly at Lowell, Providence, Pawtucket, Patterson, and Matteawan (New York).

The following extracts from that pamphlet descriptive of those mills are interesting:—

"The cotton mills are nearly the same in the different districts. None that I am aware of exceed five stories in height, except two at Dover, which are six stories on one side and five on the other; the general height of the mills in this country is three or four stories with an attic. But the mills recently built at Lowell are five stories high, with a plain roof; from which it seems probable, that though the double roof has been the plan generally adopted, it is likely to be abandoned, as it is certainly the most expensive, nor does it give so much room for machinery as the five stories and a plain roof.

"The general height of cotton mills in Scotland is six stories, with a plain roof. Those in England are from six to eight stories high; Stirling and Beckett's mill, Lower Mosley-street, Manchester, is nine stories high.

"There are a few mills in this country driven by high-pressure steam-engines. There are four in Newport, and one in Providence, Rhode Island; and three in Newburyport, Massachusetts. The coals used, whether anthracite or bituminous, cost from seven to eight dollars per ton. In general, the mills throughout the United States are moved by water; indeed, the water power resources of this country are incalculable, and many years must elapse ere they can be fully brought into use. In arranging the mills, the water-wheels are necessarily put under cover, so as to be kept in an atmosphere considerably above the freezing-point in winter; otherwise the severity of the frost, which frequently descends to nearly thirty degrees below zero, would prevent them from operating a great part of the year.

"The cost of the buildings, machinery, &c., is a great deal higher in America than in Britain, as well as the general rate of wages, particularly in the carding department.

"After comparing the advantages and disadvantages of each, it appears that the British manufacturer can produce his goods at least nineteen per cent cheaper than the American.

"The British have, no doubt, attained to great perfection in the art of manufacturing cotton goods; but whether they will be able to maintain that high pre-eminence to which they have arrived, or have to yield to the increasing improvements of foreign nations, are questions of difficult solution. Their most powerful rivals are, doubtless, the Americans. [No, the unprotected Swiss cotton.] The manufacturers of no other country can purchase their cotton so cheap, and it is presumed no country possesses such extensive water privileges; only a small portion of which has yet been occupied. If we add to these, the intelligence and enterprising spirit of the people, it will at once be evident to every unprejudiced mind, that the American manufacturers are the most formidable competitors with which the British have to contend in foreign neutral markets. This can only prove true when lands become scarce and dear, and the wages of labour low in America."

Moral Character and Health of those employed in the Factories.—A writer on American manufactures, in a recent number of *Hunt's Magazine* observes, that "The people in this country (Massachusetts) are peculiarly jealous of all those measures of policy whose tendency is in any way to debase the more active classes; and it is well known that they watch with lynx-eyed vigilance all those interests which abroad have induced in any measure such a result. It is also well known that it is in the power of the majority at all times to discountenance measures which lead to the consequences that we have described. The principles of our holy religion are too deeply implanted in the soil to further that course of policy which might lead either to vice or ignorance; and it is well known that in no other part of the globe are moral principles more widely diffused than in that particular section of the republic where the manufacturing system the most extensively prevails. The husbands, the fathers, and the brothers of those who constitute the active agents of this system, are themselves voters, and some of them even the legislators of the country. We have, moreover, so much faith in the conscientious integrity of the factory owners themselves—many of them true-hearted men as we know them to be—as to believe that they would never be willing to foster any course of legislation which should have a tendency, in the remotest degree, to endanger the intelligence or the morals of their fellow citizens, and equal confidence in the people of the country, who we believe will never countenance any form of national abuse. Nor do we believe that the condition of the factory operatives of the United States is such as to warrant any fears respecting their present state. In the interior of New England, we all know, that many of them are employed near their own homes, and within the range of the oversight of their friends; and so far as morals are concerned, it is believed that the factory establishments afford as much purity in this respect as is found in other branches of occupation. As regards the health of the active agents of the cotton establishments, evidence has been from time to time adduced upon that subject even here; and it would seem that the advantages of the operatives in this respect are as great as are furnished by most other kinds of active employment. We learn from a work which has been recently issued, that the health of six females out of ten is better than before being employed in the mills, and that of the males, one-half derive the same advantage. Nor is factory labour pursued here as in England—a continuous business for life. The young men and women of the country, in those places where the factory system prevails, employ their industry in these establishments, not as a main object of pursuit, but as a stepping-stone to a future settlement, or to other occupations. When they have, by dint of labour, procured for themselves a small sum, it not unfrequently happens that they marry and engage in other pursuits, or emigrate to the broad and rich fields of the west, where the soil, like a kind mother, opens its arms to receive them, and where they settle down permanent freeholders, perhaps the future legislators of the country.

Hours of Labour.—As regards the hours of labour—taking Lowell as a test—it appears, that work is commenced in the morning, from the 1st of September to the 1st of May, at daylight, or as soon as the operatives can see, and is discontinued during these eight months at half-past seven in the evening. From May to the first of September, five o'clock in the morning is the time for the commencement of the work, and it is stopped in the evening at seven o'clock. Half-past twelve is the dinner hour during the year, forty-five minutes being allowed for that purpose during the summer months, and thirty during the other eight. The following table from an experienced manufacturer, Mr. Montgomery, gives the average hours of labour during the year.

Average hours of work per day throughout the year

MONTHS.	Hours.	Mio.	MONTHS.	Hours.	Min.
January	11	24	July	12	45
February	12	—	August	12	45
March	11	52	September	12	23
April	13	31	October	12	10
May	12	45	November	11	56
June	12	45	December	11	24

"This statement may, perhaps, apply to most of the manufacturing establishments in the

eastern portion of the country, although the hours may vary somewhat in the middle and southern districts. The *four holidays, fast, independence day, thanksgiving, and Christmas*, besides the sabbath, of course, are devoted to rest, religious duties, and amusement.* It may be mentioned, also, that the average wages of females at Lowell is two dollars a week, besides their board, and that of the men is about eighty cents per day, besides their board.**

EXPORTS OF DOMESTIC MANUFACTURES OF COTTON FROM THE UNITED STATES.

The following statement, showing the annual amount of the exports of domestic manufactures of cotton to each of the different countries to which they were chiefly exported from the United States in each year, from 1826 to 1842, have been compiled from the annual reports of the secretary of the treasury, on commerce and navigation;—

MEXICO has been a regular, and, for several years, a large customer, as well for coloured as for white goods. Of the former, in 1826, she took 20,464 dollars; in 1835, 291,780 dollars; since then there has been a falling off in the amount, so that, in 1841, it was only 52,079 dollars. Of white goods she received, in 1826, 309,807 dollars; in 1835, 1,054,608 dollars; which has since gradually declined to 61,583 dollars, in 1841, owing, probably, to the perturbed state of that country:—

TEXAS, considering the unsettled state of the country since its independence, has formed a

* "The average time of working in the mills per day, is about twelve hours and a quarter. The female operatives remain in the employ of the companies, on an average, a fraction over three years. Their average ages probably range from fifteen to twenty-four. Very few are under fifteen, and not many over twenty-four. The expense of a female employed in the mills, exclusive of board, need not exceed forty dollars per annum, even when she dresses elegantly on sabbaths and holidays, and well every day. She may therefore save, in three years, 186 dollars, enough to purchase a small farm in the western country, or to decently furnish a young mechanic's or farmer's house in New England. It is a very important fact, that most of the girls employed in the mills take good care of their earnings. The cashier of the savings' bank informs me, that of 386,000 dollars deposited in that institution, 250,000 dollars belong to the operatives, mostly females, employed in the factories. Some young females come here from the surrounding country, work a few years, and employ their earnings to aid their fathers to pay small debts; some to procure the means of completing a genteel education at some one of our numerous New England academies. The majority, however, save their money to furnish the houses of their future husbands. It is supposed that their chances of marrying are increased, rather than diminished, by their residence and employment in the city. Not a few are betrothed before they enter the mills; and while the young men, to whom they were to be wedded, are labouring here or elsewhere for the means to purchase a farm and build a house, they labour for the means to furnish it, and in most cases successfully too."—Note to article in *Hunt's Magazine*.

considerable outlet for American manufactures, and, when established, will no doubt afford a permanent and extensive market. The first exports appear to have been made in 1837 :—

HOLLAND, in 1832, received 900 dollars, in 1837, 5027 dollars' worth of white goods, and in 1843 252 dollars' worth of white goods.

HANSE TOWNS, in 1826, took 315 dollars' worth of white goods; in 1832, seventy-two dollars; in 1834, 820 dollars; in 1839, twenty dollars; in 1840, 2150 dollars; in 1841, 1412 dollars; and in 1837, 288 dollars' worth of coloured goods; in 1842, fifty dollars of white; and in 1843, 885 dollars' worth of white goods.

BELGIUM, in 1840, received 341 dollars, in 1841, 10,894 dollars' worth of cotton goods, but in 1842 and 1843 none.

FRENCH WEST INDIES have constantly received a small amount, chiefly white goods.

and in 1826, twenty dollars' worth of coloured goods; 1827, forty-seven dollars; 1833, 472 dollars; 1834, 144 dollars; 1840, 158 dollars; 1841, sixty-eight dollars; 1842, coloured, 123 dollars; white, 7454 dollars; and in 1843, 479 dollars coloured, and 2243 dollars white goods.

FRANCE, on the ATLANTIC, received, in 1832, 100 dollars' worth, and in 1838, 310 dollars' worth of white goods. Her African settlements took, in 1830, 266 dollars' worth; and her ports on the Mediterranean, in 1830, received 1292 dollars' worth; in 1833, 450 dollars' worth; in 1835, 931 dollars' worth; in 1836, 1837, 1838, 1839, 1840, and 1841, none; in 1842, 2398 dollars' worth; and in 1843, none.

RUSSIA received, in 1830, fifty-two dollars' worth, and in 1839, 12,131 dollars' worth of white goods.

ENGLAND, and the dependencies of Great Britain.—To England, the amount is very small, and probably was only designed to exhibit samples of different American manufactures. In 1826, only 664 dollars' worth; in 1829, 450 dollars' worth of white goods. In 1828, the first coloured goods were sent, amounting only to 273 dollars; in 1830, 1852 dollars; in 1832, 2289 dollars; in 1833, 1861 dollars; in 1834, 4566 dollars, all white goods. In 1835, 573 dollars' worth of coloured goods; in 1836, 2233 dollars' worth of white, and 8580 dollars' worth of coloured goods; and in 1837, 11,899 dollars' worth of coloured goods, which appears to be the last export up to 1841. Several of her colonies have been regular customers, to some extent.

BRITISH EAST INDIES.—In 1827, the export commenced, and has been continued ever since, increasing, till, instead of deriving, as formerly, from this quarter, our principal supply of white goods, we received not a piece from thence in 1840 and 1841; but in each of those years furnished them with over 150,000 dollars' worth of our own manufacture.

In 1832, eighty-seven dollars' worth of coloured goods were exported to the East Indies; in 1838, 5914 dollars' worth; in 1839, 442 dollars' worth; in 1842, 9905 dollars' worth; and in 1843, 708 dollars' worth.

ST. HELENA.—In 1833, 2426 dollars' worth of coloured, and 1846 dollars' worth of white goods, were exported to this island; and in 1834, 1407 dollars' worth of coloured, and 7108 dollars' worth of white goods; none since.

The CAPE OF GOOD HOPE received from us, in 1826, 584 dollars' worth of white goods; in

1833, 865 dollars' worth; in 1835, 2,015 dollars' worth; in 1836, 1,023 dollars' worth; and in 1838, 552 dollars' worth. Here the exportation ceased.

GIBRALTAR.—There have annually, since 1826, been clearances of our manufactures for this port, chiefly white goods.

In 1828, 446 dollars' worth of coloured goods were exported; in 1830, 280 dollars' worth; in 1834, 2,153 dollars' worth; and in 1839, 933 dollars' worth.

MALTA.—Prior to 1834, Italy was included with Malta. In that year Italy received from the United States 2,041 dollars' worth of white goods; in 1835, 10,475 dollars' worth; in 1837, 11,695 dollars' worth; in 1838, 5120 dollars' worth; in 1839, 13,407 dollars' worth; and in the same year, 383 dollars' worth of coloured goods. Since then no exports of cotton goods have been made to Malta.

BRITISH WEST INDIES.—In 1826, eleven dollars' worth of coloured, and 1122 dollars' worth of white goods, were exported to the British West Indies from the United States. From that year, to 1831, there was no further export. Since then, it has amounted annually to more or less.

The supply of coloured cottons from France, appears from the foregoing table not to be diminished—of white goods there is a partial reduction.

* *Mousselines de Laines*.—"On the 1st of February, 1840, a new pattern of mousselines de laines arrived from France at New York, and was offered by the importer at fourteen cents per yard by the case. The agent of a Rhode Island calico-printing establishment forwarded a piece of the new style of goods to Providence the day after their arrival, and in sixteen days he had the same style of goods, and of equal fabric, in New York, selling at ten cents per yard. The manufacturer had but twelve days to engrave the new pattern on a copper cylinder, from which the engraving was raised on a steel cylinder, then hardened and made ready for impression; the compound of ingredients for colour discovered by chemical experiments; the cloth printed, dried, and cased for market."—*Hunt's Magazine*.

* All the statements of imports and exports for 1843 are for the nine months ending the 30th June. All previous statements are for the year ending 30th September. For subsequent years, according to Act of Congress, the statements are to be for the years ending 30th June.

WOOLLEN MANUFACTURES.

The manufactures of woollen cloths have certainly not succeeded so extensively, nor so advantageously as those of cotton. But if we take into account the common woollen cloths, generally in America called *home spuns*, these fabrics

have been, and continue to be, of great importance in nearly all the agricultural districts, except in those of the southern slave states. The wool of all the sheep in the United States being spun, dyed, and woven, milled and worn in the country, is sufficient proof of the fact that it supersedes so much for wear of other fabrics. The high duties, however, increase the price to the weaver of all woollen fabrics, so long as there is not a surplus of domestic woollens over the general consumption of the country.

The number of sheep in the United States, in 1831, was estimated at 20,000,000. In 1825, there were, in the state of New York, from actual returns, 3,499,549. The quantity of wool, taking an average of three years, was estimated by a committee, in 1831, at 50,000,000 lbs. per annum, and the quantity imported, to be spun and woven in factories and families, amounted, in 1831, to 5,622,962 lbs. Mr. Pitkin observes that,

"Although the returns in relation to the manufactures of the United States, made to the secretary of the treasury, in 1832, in pursuance of an order of the House of Representatives, were generally deficient; yet they show, that, in some of the states, the manufacture of wool, cotton, and iron had been carried to a great extent, in fixed establishments. In Massachusetts, the value of woollens, in these establishments, exceeded 6,500,000 dollars. In the county of Worcester alone, in that state, the manufacture of wool amounted to 2,499,500 dollars, and the value of agricultural products consumed by the labourers in the woollen establishments, in that county, according to returns of the manufacturers, was 1,776,000 dollars.

"In estimating the value of woollens made in this country, it should be borne in mind, that, notwithstanding the numerous fixed establishments for the manufacture of this article lately erected, household, or family manufactures of wool, and mixtures of wool and cotton, are still carried on to a great extent.

"In the year 1810, the whole number of fulling mills in the United States, as returned by the marshals, was 1682, and the carding machines 1630; and, in 1825, in the state of New York alone, the number of the former was 1222, and of the latter, 1580; and it will be remembered, that the number of looms in this country, in 1810, was 324,998, principally in families.

In 1825, the number of yards of fulled cloth made in families, in the state of	dollars.
New York, as official returns show, was 2,918,233, valued at	2,918,233
The number of yards of flannels, and other woollens, not fulled, was	
3,468,001, valued at twenty cents per yard	693,600

Making..... 3,611,833

The value of the same kinds of cloth, made in families in that state, at the present time (January, 1835) must be, at least, 4,500,000 dollars; and there can be little doubt, that the household manufactures of wool, in New England, must equal, if not exceed, those of New York. The agent appointed by the secretary of the treasury, to ascertain the manufactures in New Hampshire, states, in his return, that in 125 towns, whose population was 148,647, one-half of the clothing of the inhabitants was made in families; the value of the whole being estimated at 2,380,048 dollars. The greatest part of the cloth made in these towns must have been woollen.

"The agent for New Hampshire, however, and those employed by him, attended to these subjects of inquiry, much more than the agents in the other states; and his answer will tend to elucidate the question now under consideration. He stated, in his return, 'that in the counties of Rockingham, Stafford, Grafton, and Coos, containing 125 towns, and 148,647 inhabitants, the expense of each individual, annually, for cloths of all descriptions for *wearing apparel*, is sixteen dollars, making the expense to the whole population, of 2,380,000 dollars. Allowing,' he adds, 'seven persons to a family, there would be 21,250 families, the average expense to each of which, for bedding, carpeting, table linen, &c., is nineteen dollars, equal to 403,712 dollars; so that 2,783,860 dollars are *yearly* expended for cloths, for wearing apparel, bedding, carpeting, &c. Something more than one-half of these cloths are manufactured in families.' The expense of clothing each individual in the counties of New Hampshire, above referred to, was sixteen dollars; and as this clothing must have consisted principally of woollens and cottons, we think the sum of ten

dollars for each person in the United States, for this kind of clothing, cannot be deemed an over-estimate.

"The manufacture of carpets has lately increased in this country very rapidly. In December, 1834, there were in operation, in the United States, at least, 511 carpet looms, in from eighteen to twenty factories; of which eighteen were for Brussels, twenty-one for what are called treble ingrained, 424 for other ingrained, forty-four for Venetian, and four for damask Venetian; and that the number of yards of carpeting, produced yearly from these looms, was as follows:—

	yards.
Brussels.....	21,600
Three ply	31,500
Other ingrained	954,000
Venetian	132,000
Damask Venetian.....	8,400

Making..... 1,147,500

The average value of carpeting may be estimated at one dollar per yard."

Such, according to Mr. Pitkin, was the state of the woollen manufactures in the year 1834; and he states that there were in other states a great quantity of common carpeting made in the houses of families.

In 1840, the number of sheep in the United States, are given in the marshal's returns—(see Table of Live Stock)—at 19,311,374. The annual quantity of wool at 35,802,114 lbs. If these returns be true, the estimate given in the report for 1831 (viz., 20,000,000 sheep), must have been either greatly exaggerated or there has been but little increase since that period; which is not likely, unless the increased demand for mutton for food has been equal to the annual increase of the number of sheep. The estimate of the quantity of wool, in 1831 (viz., 50,000,000 lbs.), must have also been greatly overrated. Other statements estimate the number of sheep in the United States as much greater than the official returns. Some authorities as high as 35,000,000.

"Hosiery," says Mr. Ellsworth, "is now made in the United States with astonishing rapidity, by the aid of the power weaving loom, an American invention, which has not yet been introduced into England. While, there, it is a full day's work to knit by hand two pairs of drawers, a girl, here, at two dollars fifty cents per week, will make, by the power-loom, twenty pairs in the same time. A piece, twenty-eight inches in width, and one inch long, can be knit in one minute, thus reducing the expense of manufacturing this article one-tenth of the former method by the hand-looms. The importance of this improvement may be estimated from the fact, that the quantity of hosiery used in the United States is valued at 2,500,000 dollars; and the stockings, woven shirts, and drawers, made in this country, at 500,000 dollars."—*Report for 1843*

The *exports* of woollen manufactures from the United States are not of sufficient importance to be enumerated.

For the number of woollen factories, fulling mills, persons employed, value of fabrics, and capital invested, see tabular statements hereafter.

MANUFACTURES OF SILK.

The only information that we possess, on which we place any dependence, on the subject of silk manufactures in the United States, are Mr. Ellsworth's reports. He observes :—

“ That the manufacture of silk has been carried to great perfection. A large establishment in Baltimore manufactures immense quantities of silk and worsted vestings, employing some fifteen or twenty Jacquard looms, and working up large quantities of domestic silk ; and yet they dare not let it be known that their goods are manufactured in this country. But there are other manufactories in various parts of the country, which furnish sewing silk, fringe tassels, gimp, satin, velvet, and other silks. The uniform testimony of those employed in these establishments (some of whom have followed the business for twenty or twenty-five years in England), is, that they never saw finer, or as fine silk, as the American, when carefully prepared. It is said to give a stronger thread than foreign silk, and, by many manufacturers, is altogether preferred. The experiment of making paper from mulberry leaves, which is said to have been successful in France, is to be fully tried in this country the present year. It is said that a discovery has been made, that pongee silk is produced from the fibrous bark of the mulberry, and that it has never passed through the silkworm. It is also said, on the same authority, that ‘ there is nearly 100 per cent difference in the use of foliage in raising cocoons. That to produce one cwt. of cocoons, from twenty to twenty-two cwt. of foliage of grafted trees, propagated by grafting buds, cuttings, or layers, is necessary ; while from twelve to thirteen cwt. of leaves from seedlings will accomplish the same result.’

“ The profit and feasibility of the raising and manufacture of silk are also fully established. One person, who produced raw silk, says, that his net profit was equal to sixty dollars per acre. At a large establishment in Massachusetts, the profits are estimated at thirty-seven and a half per cent. To show the kind of manufacture, and the amount of capital invested, and nature of expenses, we insert the following account with reference to a fine manufactory in Ohio :—‘ My factory is in full and successful operation, producing more goods than at any time previous. Our operations, as per factory books, and account stock, taken August 8th, for the past sixteen months, are as follows, in a condensed form, viz. :—

Cash value of factory buildings.....	dollars.
Ditto, ditto, machinery, engine, and permanent fixtures.....	1,340
1,067 bushels of cocoons purchased.....	4,060
280 lbs. reeled silk purchased.....	3,600
	1,400

Carried forward 10,400

	dollars.
Brought forward.....	10,400
Contingent expenses, &c.....	604
Wages paid factory hands, &c.....	3,152
Dyeing, dyes, &c.....	607
Wages paid weavers.....	1,610
8000 bushels of coal, at five cents.....	400
Total	16,773
In buildings	1,340
In machinery, &c.....	4,060
Manufactured 3731 yards of velvets, vestings, dress, and other silks, &c.....	6,324
1006 cravats and handkerchiefs.....	1,396
850 pairs of gloves and stockings.....	875
70 pairs of shirts and drawers	325
10 lbs. of sewings	100
Contingent credits.....	1,000
Cocoons, reeled and other prepared silk, warps in looms and other stock, coal, &c., per invoice	3,180
Total	18,600

MANUFACTURE OF FLAX AND HEMP.

In the early history of the colonies, Douglas, in his Summary, informs us, that the people from the north of Ireland, in 1750 to 1759, had greatly improved the fabrics of linen, and all manner of spinning, and for a long period linens made in families of the flax grown in the country, was generally worn by the agricultural population.

In 1810, the quantity of linen cloth made in families, as returned by the marshals, was 23,503,590 yards, then valued at 8,261,361 dollars; in some of the states, however, that made from flax was not distinguished. In New York, the quantity made from flax, was 5,372,645 yards, valued at 2,014,741 dollars, or about forty cents per yard; and in Virginia, was 5,155,798 yards, valued at 1,718,599 dollars, or thirty-three and one-third cents per yard. Since that period, we have no data, by which to determine either the relative increase or decrease of the linen manufacture, nearly the whole of which is still carried on in families. In proportion to the population, it has, no doubt, decreased. In 1824, the quantity of linen and cotton cloths made in families, in the state of New York, was 8,079,992 yards, then valued at 1,211,998 dollars, or fifteen cents a yard. The returns did not show the quantity made from flax, but it was probably one-half.—*Pitkin*.

The manufacture of cotton bagging has increased, with the increase of cotton, and has become an article of no small importance to the cotton planter. It has, in the same ratio of increase, supplanted bags made of hemp and flax.

In 1833-4, according to Mr. Pitkin, there were about 1,100,000 bales of cotton raised in the United States, requiring about five yards of bagging for each bale, making 5,500,000 yards necessary for the annual consumption. The average quantity of this article imported, in the years 1832 and 1833, was 1,112,000 yards, leaving for consumption of domestic production, say 4,400,000 yards, which, at twenty cents per yard, is 880,000 dollars; and the whole value of the domestic manufacture of flax and hemp, in the United States, he is of opinion ought not, at that time, to be estimated higher than between 5,000,000 and 6,000,000 dollars.

By a joint resolution of Congress, agents are to be appointed, to reside in Kentucky and Missouri, for the purpose of purchasing water-rotted hemp; and the said agents are restricted, by the resolution, in their operations, so far as regards price and quality, that *the article is not to cost government any more than the same quality may be bought for in seaport towns*. "The quantity," says *Lyford's Commercial Journal*, "will probably depend upon the wants of government, expressed in

the form of requisitions at irregular periods, in the shape of proposals to supply the demand required at named points."

The ability of the western states to furnish hemp, may be inferred from the fact that, in 1840, according to the report of the marshals appointed to take the census, Kentucky returned 9992 tons of hemp and flax, and Missouri 18,010 tons. The manufactures in the former, from flax, are put down in valuation at 7519 dollars; and of cordage, at 1,292,276 dollars. In the latter, there are no manufactures from flax, but of cordage, to the amount of 98,490 dollars—total value of cordage (which, we presume, means principally bale rope), 1,390,760 dollars. A small portion, only, of flax could have been included in the return of Kentucky, from the proportion the manufactures appear to bear towards that of hemp.

It appears that there were grown, in Kentucky, in 1842, 14,000 tons, equal to 28,000,000 lbs. of hemp. From this amount, it is estimated there was manufactured, in 1843, 6,500,000 yards of bagging, and 7,000,000 lbs. of bale rope. Of the bagging, 2,000,000 yards were made by steam factories, and the remaining 4,500,000 yards by hand looms, there being about 300 of the latter in the state, each of which to be woven 15,000 yards. The counties which produced hemp, are—

COUNTIES.	Tons.	COUNTIES.	Tons.
Jefferson.....	500	Fayette.....	3000
Shelby.....	1000	Mason.....	2500
Woodford.....	2000	Jessamine.....	1500
Franklin.....	500	Mercer and Boyle.....	500
Scott.....	1000	All others.....	2000

The 300 looms are distributed—Woodford county, sixty; Fayette county, eighty; Franklin county, thirty; Scott county, thirty; Jessamine county, thirty; Mason county, twenty; all other counties, fifty.

The St. Louis Chamber of Commerce reports that hemp is fast becoming a leading article of trade in that city. "There are already two large manufactories of bagging and bale rope here, and several rope-walks, and there are a number of establishments in various parts of the state. The quantity of hemp manufactured and exported, in 1842 amounted to 1460 tons, and the quantity grown in this state was 1500 or 1600 tons, of which 380 tons were shipped to Kentucky, twenty tons to New Orleans, and the balance manufactured in this state." *Cables and cordage* are extensively manufactured for the use of shipping and river craft.—(See tabular statement of manufactures.)

LEATHER AND LEATHER MANUFACTURES.

This branch is of great extent and importance, especially in the states of New England, New York, and Pennsylvania. Mr. Pitkin, in his statistics, brought down to 1834, says:—

“The business of making shoes, boots, saddlery, harness, and trunks, is carried on in almost every village and town throughout the United States. The inhabitants of some towns are almost exclusively employed in making shoes alone. In the town of Lynn, in Massachusetts, the number of shoes made in 1832, was 1,675,781, valued at 942,191 dollars; giving employment to 1741 males, and 1775 females. Many of the fishermen at Marblehead, not finding a market for their fish, have lately turned shoemakers.

“The manufacture of leather is carried on to a great extent in the states of New York and Pennsylvania. From fifty-three tanneries, in the former state, there was sent to the city of New York, in 1831, sole leather to the value of 1,578,900 dollars; when to this was added, the sole leather of other tanneries, and also the upper leather, calf skins, goat and sheep skins, from the other principal tanneries, the value was estimated at 3,458,650 dollars.”

“The improvement,” says Mr. Ellsworth, “in the manufacture and making up this article, has also greatly reduced the price of shoes. By further inventions to render leather water-proof, likewise, much has been done to protect the health, and promote economy. ‘Those who have not turned their attention to this subject, may be surprised to learn that leather, made water-proof in the best manner, will last at least one-third longer than other kinds.’ Allowing, therefore, three dollars per head for each person in the United States for shoes, the cost of the whole article in the country would be 50,000,000 dollars, one-third of which, sold, would be over 16,000,000 dollars.”

In the New York manufactory of shoes by machinery, it is stated, that—

“The sole-leather is first pressed between wooden rollers, which makes it extremely firm and compact; much more so than hammering can do. It is then placed under a cutting machine, which, at one operation, cuts it into the proper shape. Meantime, another machine is busy making steel wire into screws of about three feet in length, all of which is done with surprising celerity. A fourth machine punches the soles with holes, inserts the screw, and cuts it off at the proper length. All that is then necessary, is to rivet the screws by a few blows with a hammer, on an anvil. The soles manufactured in this way are superior to the Napoleon, inasmuch as the rivets adhere better, and the leather is rendered more compact. They are produced with infinitely less labour, and can be afforded about fifty per cent cheaper.”

On the subject of the leather manufactures, *Hunt's Merchants' Magazine*, for 1844, affords the following information:—

“It is within the last twenty years that the manufacture of leather, sole-leather more particularly, has risen to high character and importance in the state of New York.

“Previous to this period the tanning of leather had been carried on chiefly in Pennsylvania, New Jersey, Maryland, and Delaware, and in the eastern states, Connecticut, Massachusetts, and

Vermont, the former tanning *exclusively* with *oak bark*, and the latter *chiefly* with *hemlock*.* Indeed, it may be truly asserted that the New York market was supplied almost entirely with leather from these different sections of our country; and behold the change; the state of New York has become now the tanning region, the city of New York the great leather market of the union, and there are more foreign hides imported into the city of New York than in any other city in the world.

"The first effort of consequence made to establish large tanneries in this state was by an association of gentlemen, under act of incorporation, styled the 'New York Tannery.'

"The company located their tannery in the town of Hunter, Greene county, twenty miles west of the North river; and, after prosecuting the business for a period of five years *unsuccessfully*, were compelled, finally, to close up their affairs, sell their lands and buildings, and abandon to individual enterprise the task of rearing up and firmly establishing this business in the new region.

"The spur, however, had been given, the impulse felt, and long before the company had ceased its operations, many extensive tanneries, capable of competing successfully with those of other states, and rivalling the great incorporated pioneer, had started into existence. Indeed, when we recur to that early period in the history of tanning in this state, and then dwell on the present, we are struck with wonder at the rapid progress and stirring enterprise everywhere exhibited. In every hemlock forest, on every falling stream, and accompanying the interior settlements in every direction, may be seen tanneries of the largest structure, giving employment to the wood-cutter, the bark-peeler, the teamster, and the wheelwright; and under the consuming fires of their never-glutted 'leeches,' the forests of hemlock are rapidly giving place for the plough of the husbandman; villages and mills arising as by the bidding of an enchanter's wand, where before was the inaccessible waterfall; and macadamized roads and turnpikes, traversing mountains heretofore deemed impassable.

"In the region of the Catskill mountains, the great sole leather tanning district, and in an extent embraced within the limits of the counties of Greene, Delaware, Schoharie, Sullivan, and Ulster, there were, in the year 1820, but three tanneries of any considerable size, and the amount of leather manufactured in them of trifling importance—in the aggregate, perhaps, 40,000 sides; value, some 100,000 dollars. There are now in the same district, without enumerating many small ones, fifty-six tanneries of capacity sufficient to manufacture annually 328,000 hides, equal to 656,000 sides, or 9,840,000 lbs. of sole leather, and in value 1,672,800 dollars!!

"The tannery at Prattsville, in the state of New York, is described as to have existed and thriven by Colonel Pratt commencing the world with that sometimes useful companion, *Poverty*, and, after struggling through the early period of his life with the difficulties and embarrassments incidental to such a connexion, he resolved to seek his fortune 'farther west.' With this determination, he penetrated what at that period (1824) was deemed almost a wilderness, the interior of the Catskill mountains. A situation on the banks of the Schohariekill presenting to his mind great natural advantages he resolved to establish himself there. In the incredibly short space of *ninety days* (we have the fact from himself), he had his tannery erected, and ready to commence operations.

"He then procured a stock of hides† in the city of New York, which he transported over the mountains to his factory, by the most difficult and unbroken roads. In a new country, inconveniences and difficulties presented themselves in every shape—new machinery to be tried, altered, or thrown away, unskilful workmen and labourers to be trained and 'broken in,' bark to be peeled, and dragged from the mountains. In addition, the stock of leather, injured by negligence or want of skill on the part of his workmen, was returned to a low and glutted market, and forced off at ruinous prices. All these adverse circumstances were enough to discourage him, but did not; they only served to awaken still further his energies, and stimulate him to renewed exertions. He is now, after the lapse of sixteen years, the proprietor of the largest tannery in America, perhaps in the world, the *purchases and sales* for which have amounted during that period to the immense sum of *two millions and a half of dollars*, in the centre of a beautiful village numbering in population some thousand inhabitants, containing an academy erected at his own personal cost, and which he now offers to endow with 5000 dollars, conditioned that a like amount be raised by the inhabitants; two handsome churches which he aided liberally in building, and still continues

* "It is observable that in this country, wherever the hemlock forests terminate in regions too warm for its production, there the oak forests commence;' consequently, the oak is used in the middle and southern states, almost exclusively, while in the latitudes north of the city of New York the same remark may be applied to hemlock."

† Colonel Pratt connected his tanning operations with the house of Gideon Lee and Co., in the city of New York, with whom he continued it for a period of fifteen years, until the senior members of that house retired from active business.

to help sustain; a carpet and India-rubber manufactory, employing fifty travelling agents; three grist-mills, seven saw-mills, five shingle machines, six stores, three hotels, four blacksmith shops, and a number of other mechanical trades and professions.

"It is estimated that the state of New York manufactures one-third of the whole quantity of leather tanned in the United States. There are about 450 tanneries, and the total value of leather annually is about 6,000,000 of dollars. The importation of sole leather into the United States has entirely ceased, and *although there exists a protective duty of twenty-nine per cent, it is entirely unnecessary*; indeed, were foreign markets thrown open to us, we hazard little in asserting that we could export *sole leather* to the European markets to advantage. English sheep (in the raw state chiefly), and French calf skins finished, are imported into the country in considerable quantities, and we believe profitably, but the value is trifling, compared with the great *staple, sole leather*.

"The hemlock tanneries are generally constructed of wood; all the tanning vats are under cover of the building, and are kept warm by means of stoves and heaters, in order that the operations may proceed as well during the cold, as warm seasons. The old plan, and the one pursued still in the oak tanning districts, is to lay away the leather and cover up the vats in the winter (thus being out of doors and exposed to the severity of the season), and open them again in the spring; in this way much time was lost, and the tanneries were unable to tan out but a single stock in the year. The size of the larger class of tanneries is from 150 to 400 feet in length, by thirty to fifty feet in width, containing from 100 to 300 vats—and two to eight large heaters, in which the bark is *steamed or boiled*, for the purpose of extracting the tanning; their capacities range from 3000 to 20,000 hides per annum. The Prattsville tannery is capable of tanning out within the year, 25,000 hides, or 50,000 sides of sole leather. They usually tan two stocks in the year; that is to say, the hides 'worked in' in the spring, are returned manufactured in the fall, and those 'worked in' in the fall, are returned in the spring. The tanneries are located always on some stream furnishing sufficient power to propel the machinery, and in the midst of the hemlock forests, where bark is of easy access and cheap. As the forests of hemlock become extinguished, the tanners retreat further into the interior. Among other causes which have contributed to place the state of New York in the high position she occupies as a tanning state, was the enactment of judicious inspection laws, which, while they served to guard the purchasers from imposition, also stimulated the tanners to put forth their best skill and exertions to excel. The states of Maryland and Massachusetts have both adopted, with slight modifications, the laws of the state of New York in that particular, and are now experiencing their beneficial effects.

"Within the past fifteen years, important improvements have been made in the art of tanning, and many erroneous notions exploded. The quality of sole leather has been improved in about the same ratio as the average gain in weight has been increased, which may safely be estimated on an average at twenty per cent; that is to say, hides under the old system of tanning, which yielded a gain of 130 lbs. of *leather* for every 100 lbs. of *raw hide*, will now, under the improved system, be made to yield 150 lbs. The idea that time is necessary to make the best leather, has been demonstrated to be true only to a limited extent; as good leather can be made, by the bestowment of active management and labour, in six or eight months as in six or eight years; indeed, as good hemlock sole leather as we ever saw was manufactured in eight months, and we understand that successful experiments have been recently made establishing the fact, that excellent leather can be manufactured in fifty days; and extensive arrangements are now being made to test the feasibility of the plan on a large scale."

III.—COMPARATIVE Table of Foreign Hides, Imports and Exports, at Liverpool, and New York.

Imported into Liverpool, 1824 to 1839, inclusive, 16 years.....	hides. 7,559,952
Exported from ditto, same period	2,667,775
Consumption at ditto, ditto	5,792,177
Imported into New York, ditto	9,267,118
Exported from ditto, ditto	986,870
Consumption at ditto, ditto	8,198,862

New York imported during the above period, 1,407,166 hides *more*, and exported 1,080,905 *less*, and consumed 2,406,685 more than the city of Liverpool. London imports and consumes less than Liverpool; and we know of no other city, New York excepted, that imports so largely as these two cities.

IV.—GREEN Slaughter-Hides, inspected in New York, from 1832 to 1843, inclusive.

Hats.—Mr. Pitkin says, “The American manufacturer has long since supplied the domestic market with hats, and a surplus for exportation. In 1831, the value of hats made in this country was estimated at 10,500,000 dollars, exclusive of caps of various sorts; and the number of men and boys employed directly in this branch of domestic industry was estimated at 15,000, and of females, 3000; and the amount paid for their labour was calculated to be 4,200,000 dollars.

“The manufacture of caps, of various kinds, is carried on also to a great extent; an establishment of this description in Albany has employed, in this business, from 600 to 700 persons, and has paid wages to the amount of 100,000 dollars a year. And we beg leave here to refer to a branch of domestic industry, carried on principally in Massachusetts, in making braid, or straw-bonnets, and palm-leaf hats. The value of these articles, made in 1832, as appears by the returns made to the secretary of the treasury, was from 800,000 dollars to 900,000 dollars.”

For the value made in 1840, see tabular statements hereafter.

Sugar Refineries.—In 1831, the number of sugar refineries in the United States was thirty-eight. For the present number and products, see tabular statements.

MANUFACTURES OF IRON AND OTHER METALS.

Under the head of “Metals of the United States,” we have given details of the iron manufactures; and we are enabled to add some further information from various sources. It is remarkable that iron and iron wares were made in the United States, at a period when but little iron was made, except in Sussex, in England. Douglas, in his “Summary of the British Settlements,” Vol. I., page 540, says: “Iron is a considerable article in our (New England) manufacture. It consists of three branches: 1, smelting-furnaces, reducing the ore into pigs, having coal (charcoal) enough, and appearances of rock ore. In Attleborough were erected, at a great charge, three furnaces, but the ore proving bad and scarce, this projection miscarried as to pigs, but were of use in casting of small cannon for ships and letters of marque, and in casting cannon-balls and bombs for the (final) reduction of Louisburg” in 1745 (100 years ago). 2. Refineries, which manufactured pigs imported from New York, Pennsylvania, and Maryland furnaces, into bar-iron. 3. Bloomeries, which, from bog or swamp ore, without any furnace, only by a forge hearth, reduce it into a bloom, or semi-liquified lump, to be beat into bars, but much inferior to those from pigs or refineries. 4. Swamp-ore furnaces; from ore smelted, they cast hollow ware, which we can afford cheaper than from England or from Holland.”

Speaking of Pennsylvania, he says they export considerable quantity of their

iron in pigs, bars, and pots; and at Virginia and Maryland, "towards the mountain, there are furnaces for running of iron ore into pigs and Holland cast ware, and forges to refine pig-iron into bars."

The extraordinary progress of the iron works of England and Scotland, during the present century, has created such abundance and cheapness, that high duties have been resorted to in the United States for protecting domestic iron works. This evil policy we will refer to hereafter. Except common articles of hardware, all others are produced at high prices. Among the various metallic fabrics, according to the reports of the Commissioners of Patents, we may enumerate—

Jewellery.—"In 1820, it might be said with almost literal truth, that nothing of the kind was manufactured in the United States. But now, much the larger part of all the more rich and solid articles are made in this country. There are very good and extensive assortments in the stores, where not a single specimen of foreign jewellery is to be found. Articles of English manufacture are entirely superseded by the superior skill and taste of our workmen; but there are some sorts of work done by the French jewellers which cannot be equalled here."

Pins.—"The progress made in the United States, in the manufacture of this article of universal use, within a few years, is truly astonishing. A manufactory, near Derby, Connecticut, has a contrivance for sticking pins in paper, which is quite marvellous. It takes, in England, sixty females to stick in one day, by sunlight, ninety packs, consisting of 302,460 pins. The same operation is performed here, in the same time, by one woman. Her sole occupation is to pour them, a gallon at a time, into a hopper, from whence they come out all neatly arranged upon their several papers. The mechanism, by which the labour of

fifty-nine persons is daily saved, yet remains a mystery to all but the inventor; and no person, but the single woman who attends to it, is, upon any pretext whatever, allowed to enter the room where it operates."

Nails were first made in the United States by machinery, which slit the rods, cut, and head them with astonishing rapidity. They are more brittle than wrought nails; but machine-made spikes are said to be equal, if not superior, to others. Screws, door-hinges, horse-shoes, all kinds of tools, locks, and fastenings for doors, lead pipes, and various metallic articles, cotton and wool cards, are made of the best quality. (See tabular statement hereafter.) Steam-engines and boilers, mainbrace, and other instruments, and anchors, and chain cables; articles of cast iron; agricultural instruments; and all the articles of metal made in England and France, are now made in the United States; but many of them at much higher prices to the inhabitants than they could be imported from Europe.

Hooks and eyes form another illustration of the progress of inventive industry. Thirty years ago, the price was one dollar fifty cents per gross; now, the same quantity may be purchased, from fifteen to twenty cents. "At one establishment in New Britain, Connecticut, 80,000 to 100,000 pairs per day are made and plated by a galvanic battery, on the cold silver process. The value of this article, consumed annually in the United States, is estimated at 750,000 dollars."

Horse-shoes furnish a similar proof of the bearing of the progress of inventions. An improved kind of horse-shoes, made at Troy, New York, for some time past, is now sold at the price of only five cents per pound, ready prepared, to be used in shoeing the animal. At a factory, recently erected, fifty tons of these are now turned out per day; and, it is believed, they can be made and sent to Europe, at as good a profit as is derived from American clocks, which have handsomely remunerated the exporter.

<i>Brass, copper, tin, pewter and Britannia ware.</i> —In 1833, the manu-	dollars.
factures of copper imported (exclusive of copper bottoms), was..	33,244
Of brass (exclusive of sheet and rolled brass).....	370,764
Of tin.....	11,887
Of pewter.....	11,945
Total.....	427,840

In 1832, the value of the manufactures of copper, brass, tin, Britannia ware, including clasps made in Connecticut, was 430,050 dollars.

Buttons.—The value of domestic buttons, made in 1832, was estimated at 800,000 dollars; the value of those that were gilt, being 300,000 dollars, and others, 500,000 dollars. These were made in Waterbury and Meriden, in Connecticut, and in several towns in Massachusetts.

Combs, of ivory, horn, shell, and wood, were made in different parts of the United States, the same year, to the value, at least, of from 700,000 dollars to 800,000 dollars. In Massachusetts alone, in 1832, the value of combs of all kinds was about 450,000 dollars.

These articles, not only supply the home market, but constitute a part of

American domestic exports. The value of combs and buttons exported in 1832, was 124,305 dollars, and in 1833, 142,970 dollars.

Carriages.—The making of carriages and coaches, may very properly be classed among the important manufactures of the country. The annual value made, must be, in no small degree, conjectural.

Lead.—The lead mines in the United States, have been as productive as any in the world. Those on Fever river, and in Missouri, produced the following quantities, in each year, from 1823 to 1832.

Y E A R S.	Fever River.	Missouri.	TOTAL.	Y E A R S.	Fever River.	Missouri.	TOTAL.

Carried forward	18,420,712	3,877,852	22,298,634				

The great increase in the years 1828 and 1829, reduced the price so low, as to render the working of the mines unprofitable.

American manufactures of white and red lead, as well as shot, now nearly supply the domestic market. In 1821, the quantity of white and red lead imported was about 4,000,000 lbs., valued at 322,568 dollars; and the quantity in pigs, bars, and sheets, was 3,197,409 lbs., and the quantity of shot was 2,290,596 lbs., both valued at 204,710 dollars. But since 1830, the value of white and red lead has averaged about 30,000 dollars a year; and, in 1833, the value of pig, bar, and sheet lead, was 60,660 dollars, and of shot, only 8500 dollars.

The value of white and red lead made in the country, must rest, in some measure, on conjecture. In 1810, the value, as returned by the marshals, was 325,560 dollars, principally from the city and county of Philadelphia.

The amount, at the present time (1834), cannot be less than 1,000,000 dollars. In 1833, two establishments for the manufacture of these articles existed in Salem, Massachusetts, and made the following quantities, viz.:—

	lbs.
White lead.....	2,081,894
Red ditto	42,236
Sugar of ditto.....	20,586
And which was valued at 195,000 dollars.	

Soap and Candles.—The American manufacturer has long since more than supplied the home market with the articles of soap and candles. The annual value of these articles exported, including spermaceti candles, is about 1,000,000 dollars. The amount necessary for home consumption, cannot be less, it is believed, than from 9,000,000 to 12,000,000 dollars. Estimating the number of families in the United States, at 2,330,000, and allowing four and a half dollars to each family for these articles, the value will be about 10,500,000 dollars.

The quantity of spermaceti candles, made in the United States, in 1831, was about 2,730,000 lbs., worth 709,800 dollars; and the annual value of this kind of candles exported, is about 250,000 dollars, leaving for home consumption to the amount of 460,000 dollars.

Paper.—Paper was made in New England, and probably in other parts of North America, a little more than a century ago.

In September, 1728, an act was passed, by the assembly of the province of Massachusetts bay, for the encouragement of the manufacture of this article. This act was granted to Daniel Henchman and others, the right of making paper, on condition, that, within the first fifteen months, they would make 140 reams of brown paper, and sixty reams of printing paper. This small beginning is referred to, in the report of the Board of Trade before mentioned, made in 1731; in which, speaking of the manufactures of Massachusetts, the board say, “By a paper mill, set up three years ago, they make to the value of 200*l.* sterling.”

The manufacture of paper, particularly of the coarser kind, no doubt, increased, and was carried on, to a considerable extent, before the revolution. It was mentioned by Hamilton, in 1791, as one of the manufactures, which, in no inconsiderable degree, supplied the domestic market; and Coxe, in his view of the United States, published not long after the date of this report, states, that there were then forty-eight paper mills in operation in Pennsylvania.

In 1810, the value of paper made in the country, was about 2,000,000 dollars; and there can be little doubt, that it has trebled in value since that period, and must be now from 5,000,000 to 6,000,000 dollars. The value of paper made in Connecticut, in 1832, was 546,000 dollars.

The general government has, from its commencement, imposed a protecting duty on imported paper, and admitted the raw material, of which it is made, duty free. The value of rags imported, in 1832, was 466,387 dollars, and in 1833, 411,785 dollars, principally from Italy and Trieste.

Cabinet Ware.—The value of cabinet ware was estimated, in 1831, at 10,000,000 dollars; employing 15,000 men, who received for their labour about 4,700,000 dollars. The value of household furniture, exported in 1832, was 169,038 dollars; and, in 1833, was 200,635 dollars. (For 1840, see tabular statements.)

Connecticut Clock Commerce.—It is estimated that the citizens of Connecticut manufacture clocks to the amount of 1,000,000 dollars per annum. A correspondent of the *Rochester Democrat* residing at Hartford, says:—

“For the last three years we have been gradually pushing our *notes of time* into foreign countries; and such has been our success, that within a few hours’ ride of this city, 1000 clocks are finished daily; and it is a fair estimate to put down 500,000 clocks as being manufactured in this state last year. This year the number will be still increased, as John Bull is so slow in his movements that there is no hope of reform until he has plenty of Yankee monitors. These we are now sending him by every ship that clears from our seaports. In 1841, a few clocks were exported there as an experiment. They were seized by the custom-house in Liverpool, on the ground that they were undervalued. The

invoice price is one dollar and fifty cents, and the duties twenty per cent. They, however, were soon released, the owner having accompanied them and satisfied the authorities that they could be made at a profit, even thus low. Mr. Sperry, of the firm of Sperry and Shaw, was the gentleman who took out the article. He lost no time, after getting possession of his clocks, in finding an auction house. They were made of brass works, cut by machinery out of brass plates, and a neat mahogany case enclosed the time-piece. They were a fair eight-day clock, but wholly unknown in England. The first invoice sold for 4*l.* sterling to 5*l.* sterling, or about twenty dollars each. Since that time every packet carries out an invoice of the article, and 40,000 clocks have been sold there by this one firm, Sperry and Shaw. Others are now in the business, and the north of Europe has become our customers. India, too, is looked to as a mart for these wares, several lots have been forwarded to the ports of China."

Glass.—The report of the committee of the New York Convention, informs us, that the manufacture of flint glass, is now almost equal to the domestic consumption; "that, for the manufacture of this article, there were, in 1831, twenty-one furnaces, containing 140 pots, and located at the following places:—

At Boston and its vicinity . . .	6 furnaces, with 38 pots.
„ Providence, Rhode Island . . .	2 „ „ 12 „
„ New York and its vicinity . . .	3 „ „ 22 „
„ Philadelphia	1 „ „ 6 „
„ Baltimore	2 „ „ 12 „
„ Pittsburg	4 „ „ 32 „
„ Wellsburg	2 „ „ 12 „
„ Wheeling	1 „ „ 6 „

"That the value of flint glass made in these establishments, was about 1,300,000 dollars; and that two of these, having four furnaces, with twenty-eight pots, situated in the vicinity of Boston, made annually, to the amount of 400,000 dollars, having a capital of 450,000 dollars, and paying, in yearly wages, 140,000 dollars.

"American flint glass is of an excellent quality, rivalling, in solidity and elegance, that of foreign countries. The first manufactory of flint glass in the United States, was established at Pittsburg, in 1812, and here the manufacture of this article has since greatly extended; and we have rarely felt more pleasure or surprise than in witnessing the making of this article, in a place which, but a few years before, was in the midst of a wilderness. In 1832, domestic glass, principally flint glass, was exported to the amount of 106,855 dollars.

"Nor, during the period under review, have the Americans been less successful in the manufacture of window glass, and glass bottles of different kinds. The New England crown glass manufactory, situated in Boston, having a capital of 150,000 dollars, makes glass of this description, to the value of 100,000 dollars a year. In addition to this, the committee advise us of, at least, twenty-three manufactories of cylinder window glass then in this country, ten in Pennsylvania (four being at Pittsburg and four at Brownville), two at Wheeling in Virginia, two in Maryland, two in New York, two in Ohio, one in Massachusetts, one in New Hampshire, one in Vermont, one in Connecticut, and one in the district of Columbia. These had a capital of 690,000 dollars, employed 800 men, whose wages were 230,000 dollars, and made annually 172,500 boxes of glass, or 8,625,000 feet, valued at 851,000 dollars.

"The most extensive manufactory of green bottles, demijohns, apothecaries' ware, and shop furniture, is that of Dyott, near Philadelphia; employing from 253 to 300 men and boys, and melting about 1200 tons per annum. Near Boston is a manufactory of glass bottles, having a capital of 50,000 dollars, making annually 6000 gross, and employing sixty-five men and boys."

By the report of this committee, the whole value of glass made in the United States, was as follows :—

	dollars.
Flint glass	1,300,000
Crown window glass	150,000
Cylinder window glass	851,000
Glass bottles, phials, apothecaries' ware, demijohns, carboys, &c.	200,000
	2,501,000
Employing 1800 men, whose wages amount to	600,000

From additional information obtained, subsequent to the date of the report, it was supposed that the value of the domestic manufacture of glass, was 3,000,000 dollars. In December, 1834, the number of glass works in Pittsburg had increased to ten.

In the manufacture of glass, as well as in its subsequent working, important improvements have been made. "The colouring of glass, and the production of works in painted glass, have advanced to a high state of perfection. The popular error of considering the ancient art of glass painting to be completely lost, has been exploded. The truth is, that this art at the present day exhibits a higher condition of improvement than at any former period, although the contrary opinion generally prevails. It has been found by careful experiment, that, when the metals themselves, instead of their oxides, have been fused with glass, it presents that dull, untransparent appearance, which is remarkably characteristic of ancient stained glass, and, by repeated analytical and synthetical trials, the composition of ancient glass has been fully determined. The investigation of this subject has proceeded so far, that nearly all the colours used by the artist of the middle ages for painting on glass have been determined with accuracy.

"A most interesting application of glass has been made within two or three years, in the formation of ornamental damasks, by weaving glass threads with silk. They are richer in appearance, and cost less, than the gold or silver damasks. Such improvements have been made in the process of annealing the glass, that the threads are rendered almost as pliable as silk itself.

"In the manufacture of glass a plan has recently been adopted by which it is freed from air bubbles—a consideration of great consequence in the preparation of glass for optical purposes. A vacuum is created over the melted glass, causing the air bubbles to expand and rise more readily to the surface.

"Among the trophies of the art of glass making, may be instanced here the enormous sheet of plate glass lately cast by the Thames Plate Glass Company. Its dimensions are fourteen feet eight inches in length, and eight and a half feet in width. An ingenious process for making concave glass mirrors was not long since introduced, though it involves practical objections to its common use. A large thin, and uniform glass mirror was firmly cemented to an iron rim, and, by means of an air-pump, a vacuum was created under the plate of glass, and the pressure of the atmosphere produced a concavity of the glass in proportion to the exhaustion beneath. The curve of the mirror obtained in this way cannot be very deep, and forms what is termed the catenary curve."

Glass works at Sandwich, Massachusetts.—The yards and buildings of this establishment cover six acres of ground. It employs 225 workmen, who, with their families, occupy sixty dwelling-houses. The raw materials used, per annum, are, glass, 600 tons; red lead, 700,000 lbs.; pearlash, 450,000 lbs.; saltpetre, 70,000 lbs. They consume 1100 cords of pine wood, 700 cords of oak wood, and 100,000 bushels of bituminous coal. Seventy tons of hay and straw are used for packing the glass. The amount of glass-ware manufactured, is 300,000 dollars per annum; said to be superior to any other manufactured in America, and equal to any in Europe. By the application of heated air from the steam-engine, to pans containing sea water, they manufacture about 3000 bushels of salt per annum; and all the ashes are leached, and the ley converted to potash. It is said that the saving, by this economy, which is carried through every department, is sufficient to pay a handsome dividend on the stock.—(See Glass-works, &c. for 1840—tables.)

QUANTITY and Value of Manufactured Glass Imported into the United States, in each Year, from 1825 to 1840.

1844*											

* During 1843 and 1844, the following quantities of glass were also entered under the denomination of *cut and plain*, paying specific rates of duty. Prior to 1843, these were all included under *Glassware* at *ad valorem* duties. In 1843,.... Cut glass, 18,102 lbs.; value, 6590 dollars.—Plain glass, 50,168 lbs.; value, 6319 dollars.

† Per square foot.

Distilled spirits.—In 1810, the quantity distilled was about 25,000,000 of gallons, 5,000,000 from molasses, and the remainder from grain or fruit; and the whole was then valued at 14,988,776 dollars, being more than one-tenth of all the manufactures of the United States, and between one-third and a half of the manufactures of wool, cotton, and flax, at that time.—(For Distilleries and Breweries in 1840, see tables.)

Chemical produce.—A report by a committee of the New York Convention, states, “that in 1831, there were not less than thirty chemical establishments in this country, having a capital of 1,158,000 dollars, and making various chemical articles, to the annual value of 1,000,000 dollars, and employing 900 hands. This kind of manufacture was secured principally by the tariff of 1824. The committee state, that the general price of chemical articles, in the United States, was, at that time, one-half less than before their domestic manufacture, under the tariff of 1824; and, in some instances, the difference was much greater—that in 1820, the price of Epsom salts was from eleven to twelve cents per pound—in 1824 a duty of four cents was imposed on foreign salts of this description; and the price in 1831, was three and a half cents per pound.”

“American chrome yellow was, for a short time, exported to Great Britain, not being embraced in the tariff of British duties.

“The British manufacturer of this article, however, soon procured a duty upon its importation, amounting to a prohibition. About 4,000,000 lbs. of copperas is now made in the United States; 3,000,000 lbs. in Vermont, 500,000 lbs. in Ohio, and 500,000 lbs. in other states. This article is sufficient for the supply of this country, and in 1832 was sold at two, and two and a half cents per pound.

“Among the articles made in these various chemical establishments, are calomel and other mercurial preparations, Glauber salts, Rochelle salts, tartar emetic, ammonia, sulphate of quinine, oil of vitriol, tartaric acid, aqua fortis, prussian blue, chrome yellow, chrome green, nitric acid, muriatic acid, barilla, oxalic acid, chloride of lime, chlorine of soda, refined saltpetre, refined borax, refined camphor, acetic acid, acetate of lead, nitrate of lead, prussiate of potash, bi-chromate of potash, &c.

“Most of the materials used in these establishments, are the produce of the United States; and nearly the whole of this branch of domestic industry, is a clear gain to the United States.”—*Pitkin*, in 1835. (See tabular statements for 1840.)

Salt manufacture of the United States.—The annual report of the superintendent of salt springs and inspector of salt in the county of Onondaga, the salt region of New York, for 1843, prepared and published in pursuance of the requirement of a law of the state, furnishes much valuable information touching the manufacture and trade in this important article of consumption and commerce. Taking this report and a variety of other data as the basis, we proceed to lay before our

readers, in as condensed and comprehensive form as possible, some account of the progress of the salt trade and manufacture of the United States.

The quantity of salt manufactured in the United States in 1840 added to the quantity imported in that year, would make an aggregate of 14,302,337 bushels, which would give to each man, woman, and child in the union a proportion of near seven-eighths of a bushel of salt.* The following table† exhibits the aggregate amount of salt manufactured in 1839, in each state and territory of the United States. It shows how widely this mineral, so necessary for man, is diffused throughout the country.

STATEMENT of the aggregate Amount of Salt manufactured in the year 1839, in each State of the United States.

Carried forward	5,595,136	Total.....	6,176,174

The amount of duty on salt, imported in 1840, and secured to be paid to the United States that year, was 917,362 dollars, less than four cents to each inhabitant. About four-fifths of the foreign salt imported into New York in 1841, was Turk's Island.

The following table exhibits the quantity of salt imported into the United States from foreign countries during a period of ten years, from 1832 to 1841, inclusive, and also the rate of duties, as follows :—

IMPORTS and Rate of Duties.

YEARS.	Quantity.	Rate of duty.		YEARS.	Quantity.	Rate of duty.	
	bushels.*	cents.	mills.		bushels.	cents.	mills.
1832.....	5,041,326	10	0	1837.....	6,343,706	8	8

British American colonies.....	213,527	62,121	Texas.....	150	75
Carried forward.....	213,894	62,275	Total.....	215,084	62,765

The salt springs of New York, and her facilities for manufacturing salt and transporting it to market, are superior to any in the United States. These springs are located on the Erie and the Oswego canals, and in the vicinity of the Seneca and the Oneida lakes, the borders of which will furnish wood for fuel for a great number of years; and when this is exhausted, supplies of bituminous coal can be obtained at a low rate, from the mines at Blossburg, Pennsylvania. For a market, New York has the great lakes Ontario, Erie, Huron, and Michigan, with which it is connected by means of the Erie and the Oswego canals.

The salt springs around the Onondaga lake, were known to the aboriginal inhabitants, who communicated their knowledge to the white settlers. One of the latter, about forty-five years since, with an Indian guide in a canoe, descended

the Onondaga creek, and by the lake approached the spring on Mud creek. Salt water was obtained by lowering to the bottom, then four or five feet below the surface of the fresh water of the lake, an iron vessel, which, filling instantly with the heavier fluid, was drawn up. In this way, by boiling the brine, a small quantity of brownish coloured, and very impure salt, was obtained. With the settlement of the country, the vicinage was explored, and many other sources of brine discovered. Many wells were sunk, generally to the depth of eighteen feet. There was a great difference in the strength of the water which they afforded; varying with the seasons, and diminishing in drought nearly one-third. With the introduction of hydraulic machinery for pumping, in 1822, a more rapid influx of brine has been produced, with an increase of strength, from twenty to twenty-five per cent; standing at 13 deg. on the hydrometer of Beaumé, of which, the point of saturation is 22 deg. That degree has, with little change, been since maintained.

The springs are in the marsh extending round the head of the lake. This marsh was formerly two miles long, and half a mile broad, but has been diminished by an artificial reduction of the lake. The plain, on which are the lake, and the villages of Salina and Syracuse, is bounded on the south by hills of gentle ascent and moderate elevation. The soil of the plain consists of vegetable earths, imperfectly decomposed, marls, clays, loams, sand, and gravel.

The principal springs are at Salina and Geddes. From the former the water is obtained for the works at Salina, Liverpool, and Syracuse. The well has been excavated to the depth of twenty-two feet, by ten feet in diameter.

A difference of opinion prevails relative to the source of the brine. From the fact that the circumjacent rocks, when exposed to the humidity of a cellar, gave forth crystals of salt, Mr. Eaton inferred, that the brine was produced by their elementary materials. This opinion he supposed to be supported by the absence of gypsum in the saliferous rock here. But he appears to have erred in this, since we are assured by Mr. Forman, that "it is a matter of general notoriety, that lumps of gypsum are thrown up in digging salt springs and wells in the village; and in sinking a salt well at Montezuma, 116 feet deep, beautiful specimens of gypsum were found, nearly transparent." Dr. Lewis C. Beck, and others, also dissent from this opinion; and it would seem, from later publications, that Mr. Eaton has not full confidence in his hypothesis. The general opinion is, that *beds* of rock salt exist here, as at other salt springs; and it is sustained by the fact, that the geological character of the strata, through which the brine passes, resembles that of the strata overlaying the beds of rock salt, near Norwich and Cheshire, in England; and that of the strata in the vicinity of the salt mines at Cardona, in Spain; and in other localities in Europe. Whether such deposits of rock salt have an oceanic or volcanic origin, will, perhaps, ever remain a vexed question.

If there are mines of rock salt, they lie at great depth. Borings have been made at Onondaga, at several points; in one instance, to the depth of 250 feet, without finding fossil salt, and without passing through the saliferous rock, much of the difference being in cemented gravel. But the very important fact was elicited, that the strength of the brine increased with the depth of the well.*

The salt springs next in importance to those of New York, in the United States, are those at Kenawha, Virginia. According to the last census, the quantity of salt manufactured at these salines is 1,600,000 bushels. They have the advantage of the Onondaga springs in the article of fuel, there being an abundance of mineral coal contiguous to the springs, the cost of which, delivered at the salt works, does not exceed one dollar per ton; but their brine is much weaker, as may be seen by the table taken from the report of Dr. Beck, for 1837, which exhibits the relative strength of the different brines from which salt is manufactured in the United States, as follows:—

At Nantucket	350	gallons of sea-water give a bushel of salt.
„ Boon's Lick (Missouri) . .	450	„ brine „
„ Conemaugh (Pennsylvania) .	300	„ „
„ Shawneetown (Illinois) . .	280	„ „
„ Jackson (Ohio)	213	„ „
„ Lockharts (Mississippi) . .	180	„ „
„ Shawneetown (2d saline) . .	123	„ „
„ St. Catharine's (Up. Canada) .	120	„ „
„ Zanesville (Ohio)	95	„ „
„ Kenawha (Virginia)	75	„ „
„ Grand River (Arkansas) . .	80	„ „
„ Illinois River	80	„ „
„ Muskingum (Ohio)	50	„ „
„ Onondaga (New York) . . .	41 to 45	„ „

Since the above table was published, stronger brine has been obtained at the Onondaga salines. There is an abundant supply, from thirty to thirty-three gallons of which yield a bushel of salt.

The strong brine springs near Abington are at Saltville, Washington county, Virginia. Washington county borders on East Tennessee and North Carolina. The springs are located between the Clinch mountain and Blue Ridge. While engaged in boring for these springs, in 1840, salt rock was discovered at the depth of 220 feet below the surface of the ground. This salt rock was penetrated by boring 166 feet without being passed through. It yields a large proportion of chloride of sodium. Specimens of the rock are deposited in the State Geological Cabinet, at Albany.

A correspondent of the superintendent of salt springs, in Onondaga, has recently furnished an analysis of this rock, and also of the brine of the springs, by Professor Hayben, geologist, &c., as follows, viz.:—

* *Gordon's Gazetteer of New York*, 1836.

ANALYSIS of Salt Rock.

Oxide of iron.....	0.470
Sulphate of lime.....	0.446
Chloride of calcium.....	trace
Chloride of sodium.....	99.084
	100.000

“ One pint of brine yielded, in saline matter, 2432.25 grains, equal in a gallon to 19,458 grains, or 2.77 lbs. avoirdupois. Eighteen gallons of the brine produce a bushel of salt of fifty lbs.”

Some improvements have also been made in the springs at Shawneetown, Illinois. They now furnish brine, 100 gallons of which yield a bushel of salt.

Within the past two years, a salt spring has also been discovered in a rock, boring 661 feet deep, upon Grand River, at Grand Rapids, Michigan, about forty miles from Lake Michigan. A copper tube, of three inches diameter, was inserted in the boring to the depth of 360 feet, for the purpose of excluding a weaker vein of water nearer the surface. The brine raised in this tube to the height of thirty-five feet above the surface of the ground, and flowed over at the rate of seven gallons per minute. It requires about seventy gallons of the brine to yield a bushel of salt. The manufacture of salt, upon a small scale, has been commenced at this place by the proprietors of the spring, Messrs. Lucius, Lyon, and Co.

The manufacture of salt at Onondaga springs has increased rapidly, producing, from the duty paid to the state, a very large revenue. The following statement exhibits the quantity of salt manufactured in each year, from 1826 to 1842, inclusive, and the amount of duties paid into the treasury of the state:—

Y E A R S.	Salt manu- factured.	Amount of duties collected.	Y E A R S.	Salt manu- factured.	Amount of duties collected.
	bushels.	dlsr. cts.		bushels.	dlsr. cts.
1826.....	827,508	103,438 50	Brought forward..	12,647,452	1,454,407 37

1833.....	1,838,646	229,580 75	1841.....	3,340,769	209,446 14
1834.....	1,943,252	116,595 12	1842.....	2,291,963	137,514 18
Carried forward..	12,647,452	1,454,407 37	Total	32,626,191	2,653,131 71

Previous to 1834, the rate of duty was one shilling per bushel, since which it has been six cents. This charge accounts for the diminished revenue in 1834 and 1835, upon the increased product.

By a statement contained in the report of the superintendent and inspector for 1838, we perceive that the *net* revenue from salt duties, from 1818 to 1824, inclusive, were as follows:—

Y E A R S.	Value.	Y E A R S.	Value.
	dtrs. cts.		dtrs. cts.
1818.....	36,536 62	Brought forward..	224,396 84

Carried forward ..	224,396 84	Total	452,593 39

The whole amount of duties refunded in 1842, in conformity to a resolution of the Commissioners of the Canal Fund, allowing a drawback of duty on salt arriving at certain points specified in the said resolution, is . . . 14,553 83
 Total amount of duties refunded in 1841 . . . 6,075 87

Increase in amount, paid in 1842, of drawback of duties . . . 8,477 96

This last item shows that an increased amount of salt manufactured at the springs during the past year, has been disposed of at the more distant markets.

The total amount of expenditures for all purposes during the year 1841, are . 53,984 89
 Total expenditures in 1842 . . . 42,619 96

Expenditures of 1842 less than those of 1841, by the sum of . . . 11,364 93

QUANTITY and quality of Salt inspected in each Village, during 1842 :—

In the village of Salina.—Coarse salt, 1288 bushels, twenty-two lbs.; fine salt, 845,022 bushels, two lbs.; dairy salt, 3961 bushels, forty-two lbs. Aggregate—850,272 bushels, ten lbs.

In the village of Syracuse.—Coarse salt, 149,724 bushels, eighteen lbs.; fine salt, 486,439 bushels, thirty-four lbs.; dairy salt, 18,828 bushels, twenty-two lbs. Aggregate—654,992 bushels, eighteen lbs.

In the village of Geddes.—Coarse salt, 12,009 bushels, forty-six lbs.; fine salt, 154,532 bushels, eighteen lbs.; dairy salt, 2433 bushels, two lbs. Aggregate—168,975 bushels, ten lbs.

In the village of Liverpool.—Fine salt, 615,194 bushels, forty-six lbs.; dairy salt, 2468 bushels, ten lbs. Aggregate—617,663 bushels.

TABLE showing the Number and Extent of the Manufactories employed in the manufacture of Coarse and Fine Salt, in the town of Salina, the 1st of January, 1842.

1835.....	2,209,867	266,615			

The annual consumption of salt in the United States is about 14,000,000 bushels. In the year 1841, there were 6,179,174 bushels of salt imported into the United States, of which 1,522,333 bushels were entered at the port of New York; and during eleven months of 1842, ending 30th of November last, 1,661,495 bushels of foreign salt were entered at the same port.

The whole quantity of domestic salt exported in 1841 was only 215,084 bushels, of which quantity 213,527 bushels were sent to the British colonies of Canada, where it was subjected to a duty of ten cents per bushel of fifty-six lbs.; and, in the year 1842, American salt entering the Canada ports paid a duty of twelve cents per bushel.

PRICES and Duty on Salt, from 1795 to 1843, inclusive, per Bushel.

* From 1834 to 1843, the duty was declining under the operation of the Compromise Act. The amount of duty must depend upon the price. The above is only an estimate of the duty, though probably not far from the truth.

Various other manufactures have been established, and are now being established in this country; among these, we may enumerate looking-glasses, the printing and binding of books, umbrellas, brushes of all kinds, brass nails, stockings, gloves, wafers, webbing, lace and fringes, mathematical and musical instruments, silk, whips, pocket-books, ready-made clothing, earthenware, oil, powder, beer, ale and porter, wire, brick, types, glue, clocks, printing-presses, lamps, spectacles, coffee-mills, suspenders, wool and cotton cards, oil cloths,

bellows, printers' ink, India rubber, and many others, which have not come to our notice.

Manufactures of the South and West.—"It is probable that if the manufacturing business is found sufficiently profitable for a series of years in this country, the upper parts of the Mississippi Valley will, in no long time, be the chief seat of American manufactures. Already labour and capital, to a large amount, are employed in manufactures of various sorts in the west. In western Pennsylvania, the upper part of western Virginia, and in the eastern part of Ohio, manufactories of cotton, wool, silk, paper, wooden and stone ware, &c., &c., abound."

The Greensborough *Patriot* gives an account of eight manufactories, one, the Mount Hecla, in that town, and the others in the neighbourhood; viz., the High Falls and Alamance factories, in Orange; the Cedar Falls and Franklinsville factories, in Randolph; the Lexington, in Davidson; the Salem, in Stokes; and the Leaksville, in Rockingham. That called Mount Hecla was among the first put in operation in the southern country. The Lexington and Salem factories are worked by steam. The products of these mills, besides supplying an extensive country demand, are sent off in immense quantities to the northern and western markets.

In Fayetteville and the immediate vicinity, the *Observer* enumerates six factories; viz., Mallett's, Cross Creek, Phoenix, Rockfish, Beaver Creek, and Little River.

Besides these, there are, in other parts of the state, one at Salisbury; one at Rockingham; one at Lincolnton; one at Rocky Mount, Edgecombe; one at Cane Creek, Chatham; one at Concord, Cabarrus; one at Milton; one at Mocksville; one at Milledgeville, Montgomery county; one in Surrey county; and one other in Orange county; making twenty-five in all.

The capital invested in the twenty-five is estimated, by the *Observer*, at about 1,050,000 dollars; the number of spindles about 50,000; persons employed from 1200 to 1500, and number of bales of cotton consumed at not less than 15,000.

The foregoing statements are all prepared from the official returns to Congress; from Pitkin's statistics; from the reports of commerce; from Mr. Ellsworth's reports for 1840, 1841, 1842, 1843, and 1844; and from statistical articles in *Hunt's Merchants' Magazine*.

RECAPITULATION OF THE FOREGOING RETURNS OF MANUFACTURES.

Machinery—Value of machines manufactured.....	dlrs.	1,098,581	Glass, earthenware, &c.—Number of men employed.....	3,236
— Number of men employed.....	13,001		— Value of manufactured articles, including looking-glasses.....	2,890,293
Hardware, cutlery, &c.—Value manufactured.....	dlrs.	6,451,967	— Capital invested.....	2,084,100
— Number of men employed.....	5,492		— Number of potteries.....	659
Cannon and small arms—Number of cannon made.....	274		— Value of manufactured articles.....	1,104,825
— Ditto of small arms.....	88,073		— Number of men employed.....	1,613
— Ditto of men employed.....	1,744		— Capital invested.....	551,431
Precious metals—Value manufactured.....	dlrs.	4,734,960	Sugar refineries, chocolate, &c.—Number of sugar refineries.....	43
— Number of men employed.....	1,556		— Value of produce.....	3,250,700
Various metals—Value manufactured.....	dlrs.	9,779,442	— Ditto of chocolate manufactured.....	79,900
— Number of men employed.....	6,677		— Ditto of confectionery made.....	1,143,965
Granite, marble, &c.—Value manufactured.....	dlrs.	2,442,950	— Number of men employed.....	1,355
— Number of men employed.....	3,734		— Capital invested.....	1,709,571
Bricks and lime—Value manufactured.....	dlrs.	9,736,945	Paper—Number of paper manufactories.....	426
— Number of men employed.....	22,807		— Value of produce.....	5,611,495
Capital invested in the preceding manufactures.....	dlrs.	20,620,860	— Ditto of all other manufactures of paper, playing cards, &c.....	511,597
Wool—Number of falling mills.....	2,585		— Number of men employed.....	4,726
— Ditto of woollen manufactories.....	1,420		— Capital invested.....	4,745,239
— Value of manufactured goods.....	dlrs.	26,695,999	Printing and binding—Number of printing offices.....	1,552
— Number of persons employed.....	21,342		— Ditto of binderies.....	447
Capital invested.....	dlrs.	15,765,124	— Ditto of daily newspapers.....	136
Cotton—Number of cotton manufactories.....	1,240		— Ditto of weekly newspapers.....	1,141
— Ditto of spindles.....	2,284,631		— Ditto of semi and tri-weekly newspapers.....	125
— Ditto of dyeing and printing establishments.....	129		— Ditto of periodicals.....	227
— Value of manufactured articles.....	dlrs.	46,350,453	— Men employed.....	11,873
— Number of persons employed.....	72,119		— Capital invested.....	5,873,845
— Capital invested.....	dlrs.	51,102,359	Cordage—Number of rope walks.....	338
Silk—Number of pounds reeled, thrown, or other silk made.....	15,745½		— Value of produce.....	4,078,306
— Value of the same.....	dlrs.	119,814	— Number of men employed.....	4,404
— Number of males employed.....	246		— Capital invested.....	2,465,577
— Ditto of females and children.....	521		Musical instruments—Value produced.....	923,924
— Capital invested.....	dlrs.	274,374	— Number of men employed.....	908
Flax—Value of manufactures of flax.....	do.	322,205	— Capital invested.....	734,370
— Number of persons employed.....	1,628		Carriages and waggon—Value produced.....	10,897,887
— Capital invested.....	dlrs.	298,087	— Number of men employed.....	21,994
Mixed manufactures—Value of produce.....	do.	6,544,503	— Capital invested.....	5,551,632
— Number of persons employed.....	15,905		Mills—Number of flouring mills.....	1,304
— Capital invested.....	dlrs.	4,368,991	— Ditto of barrels of flour manufactured.....	7,404,562
Tobacco—Value of manufactured articles.....	do.	5,819,568	— Ditto of grist mills.....	23,661
— Number of persons employed.....	8,384		— Ditto of saw mills.....	31,650
— Capital invested.....	dlrs.	3,437,191	— Ditto of oil mills.....	843
Hats, caps, bonnets, &c.—Value of hats and caps manufactured.....	do.	8,704,342	— Value of manufactures.....	76,545,246
— Ditto of straw bonnets manufactured.....	do.	1,476,585	— Number of men employed.....	60,788
— Number of persons employed.....	20,176		— Capital invested.....	65,853,470
— Capital invested.....	dlrs.	4,435,300	Ships—Value of ships and vessels built.....	7,016,094
Leather, tanneries, saddleries, &c.—Number of tanneries.....	8,229		Furniture—Value of furniture made.....	7,555,405
— Sides of sole leather tanned.....	3,463,611		— Number of men employed.....	18,003
— Ditto of upper ditto, ditto.....	3,781,868		— Capital invested.....	6,989,971
— Number of men employed.....	26,018		Houses—No. of brick and stone houses built.....	8,429
— Capital invested.....	dlrs.	15,650,939	— Ditto of wooden houses built.....	45,694
All other manufactures of leather, saddleries, &c.....	17,136		— Men employed.....	85,501
— Value of manufactured articles.....	dlrs.	33,134,403	— Value of constructing or building.....	41,917,401
— Capital invested.....	do.	12,881,262	All other manufactures not enumerated.....	
Soap and candles—Number of pounds of soap.....	49,820,497		Value.....	31,785,353
— Ditto ditto of tallow candles.....	17,904,597		— Capital invested.....	25,019,726
— Ditto ditto of spermaceti and wax ditto.....	2,036,951		Total capital invested in manufactures.....	267,576,379
— Ditto of men employed.....	5,641		In iron business.....	20,432,121
— Capital invested.....	dlrs.	2,757,273	In lead ditto.....	1,346,756
Distilled and fermented liquors—Number of distilleries.....	10,306		In gold ditto.....	234,325
— Ditto of gallons produced.....	41,402,627		In other metals.....	238,980
— Ditto of breweries.....	406		Coal business.....	
— Ditto of gallons produced.....	12,223		— Anthracite.....	4,355,609
— Ditto of men employed.....	9,147,368		— Bituminous.....	1,868,862
— Capital invested.....	dlrs.	317	Salt.....	6,224,464
Powder mills—Number of powder mills.....	317		Granite, marble, and stone.....	6,998,045
— Number of pounds of gunpowder.....	8,977,348		Nurseries.....	2,540,159
— Ditto of men employed.....	496		Commercial and commission houses.....	2,945,774
— Capital invested.....	dlrs.	875,875	Retail drygood and grocery, &c.....	119,295,367
Drugs, medicines, paints, and dyes—Value of medicinal drugs, paints, &c.....	do.	4,151,899	Lumber yards and trade.....	250,301,799
— Ditto of turpentine and varnish produced.....	do.	600,827	Butchers, packers, &c.....	9,848,307
— Number of men employed.....	1,848		Fisheries.....	11,526,950
— Capital invested.....	dlrs.	4,507,675	Various manufactures.....	16,429,620
Glass, earthenware, &c.—Number of glass houses.....	81		Woollen ditto.....	20,620,869
— Number of cutting establishments.....	24		Cotton ditto.....	15,765,124
			Silk ditto.....	51,102,359
			Flax ditto.....	274,374
			Mixed ditto.....	298,087
			Tobacco ditto.....	4,368,991
			Hats, caps, and bonnets.....	3,437,191
			Leather tanneries.....	4,435,300
				15,650,929

One principal cause of the growth of American Manufactures, is the difficulty which the citizens of the United States of America experience in paying for those of the United Kingdom ; arising from our non-admission of American corn, except at exorbitant duties, unless during periods of extreme scarcity in England. The Americans are now exulting over the fallacy of British legislation, in regard to corn and food, and they extol the increase of their own manufactures.

In the *New York Express*, April, 1845, we find the following remarks on the progress of manufactures in America :—

“The manufacturing interest of this country, at the present time, is extending itself faster than at any period since we have begun to manufacture for ourselves. From Maine to the extreme west and south-west, every spindle and loom is at work—many of the mills with orders for their works for months a-head. Water is no longer the sole motive power of factories, and, in the most favoured localities at the east, for manufactories this power has long been exhausted, and the never-failing power of steam has been resorted to. In Newburyport and Boston, factories of this class are now in course of erection, and even Lowell has now more factories building which are to be propelled by steam than by water. At no time have there been more new mills building, or the old ones more active than at present ; four new mills, of the largest size, are to be erected this summer, and large additions made to the old ones—in all, not less than 25,000 looms. At the new ‘city of looms,’ on the Merrimack, at Haverhill, active preparations are making to commence their dam, which, when completed, will furnish a water-power that will not be exhausted in half a century of prosperous manufacturing. In New Hampshire and Maine, there is the same tendency to invest capital in manufacturing ; cotton mills are the favoured stocks, but other articles are not forgotten or neglected. In Maine, charters have been granted for thirteen cotton and woollen mills, and two iron factories ; the old companies have also added largely to their capital stocks ; and at no time has Maine been so decidedly in favour of manufacturing as at present. At Buffalo, there has been a large mill started, with every prospect of success. At St. Louis, and numerous other points in the west, in Mississippi and Georgia, new mills are erecting. At Baltimore and Georgetown, several flour mills have been altered to cotton mills ; and all through the country there is seen a general wish to make investments in this way.”

CHAPTER XIII.

INTERNAL NAVIGATION OF THE UNITED STATES.

THERE is no part of the world so extensively favoured by nature with the facilities and power of internal intercourse, as the vast empire comprised within the United States of America. The rivers which descend into the Atlantic,—even those of the New England States, although their navigable courses from the mountains to the sea be comparatively limited, are all important as channels for the transport of commodities. The state of Maine has, by its inlets and rivers, abundant water communication, and requires but little aid from artificial construction. Where most wanted, canals and railroads have been opened or projected (for which, and the rivers of the state, see Maine). New Hampshire has several rivers, the navigation of which, where interrupted, has, in several parts, been improved by artificial means. Vermont has Lake Champlain, and numerous navigable streams. Massachusetts, Rhode Island, and Connecticut, have extended the means of internal transport by canals and railroads, which communicate between the principal seaport towns and the navigable termination of inland rivers. Railroads open a rapid intercourse direct from the Atlantic, at Boston, to the Hudson, at Albany. The Hudson, that great artery of trade and intercourse within the state of New York, opens extensive and convenient channels of transport to and from the interior,—to and from Lakes Champlain, Ontario, and Erie, with which the Hudson is in communication, by canals and railways; and, by all these, an internal navigation is opened from the Atlantic and the St. Lawrence to the waters and regions of the FAR WEST. Railroads and canals traverse the Jerseys, to Delaware bay and river. The Susquehanna,—the Ohio,—that great inlet, Chesapeake bay,—the Potomac, and numerous other streams, and canals, and railroads, extend navigation and the means of intercourse over the greater part of Pennsylvania, Delaware, and Virginia. When the projected and unfinished canals and railways are completed, the means of internal transport will be extended to all important points of these states.

The rivers and inlets of the Carolinas, Georgia, and Florida, are nearly all on a scale of minor extent, or rather depth; but they are important in affording facilities, improved by the railways and canals which have been constructed, in bringing the produce of the interior to market. Alabama has several navigable, but not deep, rivers.

The magnificent regions of the west are traversed by the great navigable waters of the Mississippi, Missouri, Ohio, and the numerous rivers which flow into them from the east, north, and west. Lakes Huron, Michigan, and Superior complete this vast extent of internal navigation.

We have, in the first part of this work, given a detailed account of the great lakes; and, in our special account of each state (which see), we have described the bays, harbours, and rivers of each. The Mississippi, Missouri, and some of their great branches, require some further description.

The MISSISSIPPI, or *Missi-Sepe*, in the Algonquin Indian language, which prevails in its upper parts, means *Great river*. Its source, according to the explorations of Schoolcraft, July 13th, 1832, is Itasca Lake, 47 deg. 10 min. north latitude, and 95 deg. 54 min. west longitude, at an elevation of about 1350 feet, and at a distance of 3160 miles, above the Gulf of Mexico. Itasca Lake is romantically situated among hills clothed with pines. The outlet of the lake is only from ten to twelve feet broad, and from twelve to eighteen inches deep. This first stream of the Great River is little more than a mere brook, flowing north and north-easterly to Lake Cass, about 184 miles, from thence it winds, generally in a south-east, south-south-westerly, and south-south-easterly direction, frequently over rapids, to the Big Falls, and thence about sixty miles further to the Falls of St. Anthony. Vessels do not ascend the river over these falls; and they pass below, over several rapids, even as low down as Rivière des Moines. The country above the Falls of St. Anthony we have described, as well as the principal tributaries which fall into the Mississippi, above, and, for a considerable distance, below and west of those falls, in our separate account of Wisconsin, Iowa, and the Western Territory. Most of those tributaries, although interrupted by some falls, and several rapids, afford, by boats and canoes, extensive and convenient means of inland transport.

The Mississippi, with its great and lesser tributaries, drain all the regions which extend from the Alleghany chain to the Rocky Mountains, with the exception of the lands drained by the streams which fall into the St. Lawrence and the great lakes.

Mr. Schoolcraft has described the Mississippi more intelligibly, and at greater length, than any other traveller. He had followed its stream, from its mouths, or delta, to its source. No other traveller had done so before him. We do not know that any other one traveller has followed his example. We have also examined the local descriptions of other authorities. It is remarkable that the greatest rivers in North and South America should have been first discovered, not upwards from their confluence with the sea, but downwards from one of their upper or main branches. The Amazon was first navigated, down to the Atlantic, by an European, Orellana, in a frail craft built near the foot of the Andes. In this vessel he floated down the Naco, an upper tributary, to the main stream of the Amazon, and thence, without compass, and through unknown regions, to the ocean.

The Mississippi was discovered in 1672, by the Jesuit, Father Marquette,

who, with his followers, by ascending the Fox river, from Lake Champlain in canoes, carried the latter and their stores, over the Portage, a few miles, to the Wisconsin, descended that stream until they reached the Mississippi, in about latitude 42 deg. 50 min. north. They floated down with its current until they passed the confluence of the Missouri, and reached some villages of Illinois, who received them hospitably. They proceeded downwards, until they arrived at the Arkansas; from which point they returned afterwards to Canada. In 1682, the intrepid La Salle sailed down the Mississippi from the Wisconsin to the Gulf of Mexico.

Mr. Schoolcraft, describing the physical character of the Mississippi, distributes it into natural divisions, as indicated by the permanent differences in the colour of its waters,—the geological character of its bed and banks,—its forest trees and other vegetable productions,—its velocity,—the difficulties it opposes to navigation,—and other natural appearances and circumstances.

He traces it from its origin in a region of lakes, which are spread over table-lands, the waters of which flow north into Hudson's Bay, south into the Gulf of Mexico, and east into the lakes, rivers, and Gulf of St. Lawrence. He follows the course of the Mississippi to the Falls of Pakagama, a distance of 230 miles "through a low prairie, covered with wild rice, rushes, sword grass, and other aquatic plants. During this distance, it is extremely devious as to course and width, sometimes expanding into small lakes, at others, narrowing into a channel of about eighty feet. It is about sixty feet wide on its exit from Red Cedar or Cassina Lake, with an average depth of two feet; but from the junction of the Leech Lake fork, increases to 100 feet in width, with a corresponding increase of depth. Its current, during this distance, is still and gentle; and its mean velocity may be estimated at a mile and a half per hour, with a descent of three inches per mile." Water-fowl and amphibious quadrupeds are met with in great numbers within this region.

Rocky strata and a wooded island appear at the Falls of Pakagama, where the river descends by an abrupt cataract, twenty feet: from which point to the Falls of St. Anthony, a distance of about 685 miles, it exhibits its second characteristic division. The prairie disappears above the Cataract of Pakagama. Groves of elm, maple, birch, oak, and ash, then rise, and extend back from the banks of the river,—overshadowing and adorning its clear and majestic waters. The black walnut first appears below Sandy Lake river, and the sycamore below the River de Corbeau. The Mississippi, in its many windings above the Falls of St. Anthony, is picturesquely adorned with innumerable, richly wooded, islands. Of its tributaries, the largest in this distance is the De Corbeau, flowing from the south-west. The Pine, Elk, Sac, and Crow rivers, also flow into it from the west, and the St. Francis and Rum River from the east. The meanderings of the Mississippi below the Cataract of Pakagama are irregular, but neither

so short nor so abrupt as above. Mr. Schoolcraft estimates the mean width of the stream at 300 feet until the junction of the De Corbeau, and below that at 250 yards.

"Its navigation," he observes, "is impeded, agreeably to a memorandum which I have kept, by thirty-five rapids, nineteen ripples, and two minor falls, called the Little and the Big Falls, in all of which the river has an aggregate descent of 224 feet in 14,640 yards, or about eight miles. The mean fall of the current, exclusive of the rapids, may be computed at six inches per mile, and its velocity at three miles per hour. In the course of this distance it receives several small turbid streams, and acquires a brownish hue, but still preserves its transparency, and is palatable drink-water. A few miles above the river Corbeau, on the east side, we observe the first dry prairies, or natural meadows, and they continue to the Falls of St. Anthony. These prairies are the great resort of the buffalo, elk, and deer, and are the only parts of the banks of the Mississippi where the buffalo is now to be found. Granite rocks appear at several of the rapids, in rolled pieces, and in beds; and, in some places, attain an elevation of 100 or 200 feet above the level of the water, but the banks of the river are generally alluvial.

"At the Falls of St. Anthony, the river has a perpendicular pitch of forty feet, and, from this to its junction with the Missouri, a distance of 843 miles, it is bounded by limestone bluffs, which attain various elevations, from 100 to 400 feet, and present a succession of the most sublime and picturesque views. This forms the third characteristic change of the Mississippi. The river prairies cease, and the rocky bluffs commence precisely at the Falls of St. Anthony. Nine miles below, it receives the St. Peter's from the west, and is successively swelled on that side by the Ocano, Iowa, Turkey, Des Moines, and Salt rivers; and, on the east, by the St. Croix, Chippeway, Black, Wisconsin, Rock, and Illinois. One hundred miles below the Falls of St. Anthony, the river expands into a lake, called Pepin, which is twenty-four miles long, and four in width. It is, on issuing from this lake, that the river first exhibits, in a striking manner, those extensive and moving sand-bars, innumerable islands and channels, and drifts and snags, which continue to characterise it to the ocean. Its bends from this point onwards are larger, and its course more direct; and, although its waters are adulterated by several dark coloured and turbid streams, it may still be considered transparent. The principal impediments to navigation in this distance are the Des Moines, and Rock river rapids. The latter extends six miles, and opposes an effectual barrier to steamboat navigation, although keelboats and barges of the largest classes may ascend. This rapid is 390 miles above St. Louis."

The crystalline transparency of the Mississippi gradually disappears, after its confluence with the Missouri. Had not the Mississippi been the first discovered and explored, the Missouri would have, as the main stream, given its name to the Great River, down to the Gulf of Mexico. The waters of the Missouri are turbid, and of a gray colour; and Mr. Schoolcraft observes, that "during its floods, which happen twice a year, it communicates, almost instantaneously, to the combined stream, its predominating qualities; but, towards the close of the summer season, when it is at its lowest stage of water, the streams do not fully incorporate for twenty or thirty miles, but preserve opposite sides of the river; and I have observed this phenomenon at the town of Herculaneum, forty-eight miles below the junction. The water in this part of the river cannot be drank until it has been set aside to allow the mud to settle." The appearance of the Mississippi, after the foul waters of the Missouri acquire the mastery, has a sooty, dark, and mysterious character, and the dismal scenery of its low muddy banks; and its dreaded snags, sawyers, sand-bars, and its numerous fixed, shifting, and unseen dangers, renders its navigation neither agreeable nor safe. Below the Missouri, its great importance must be considered in regard to its commerce, and the vast resources of the countries through which its tributaries flow. The distance from the mouth of the Missouri to the Gulf of Mexico is estimated by Mr.

Schoolcraft at 1220 miles, in the course of which it receives from the west the Maremac, St. Francis, White, Arkansas, and Red rivers; and, from the east, the Kaskaskia, Great Muddy, Ohio, Wolf, and Yazoo. This part of the river is particularly characterised by snags and sawyers, falling-in banks, islands, sand-bars, and mud-banks; the channel of which is shifted by every succeeding flood. The velocity of its stream was formerly considered so strong, that it could not be navigated by sailing vessels. This belief was unfounded, although a strong wind is required to ascend the river; and it is navigated by ocean sailing ships of from 400 to 800 tons' burden, from the Balize to New Orleans, a distance of 105 miles, and could be ascended higher, but the navigation above New Orleans is carried on chiefly by steamboats. The breadth of the river opposite St. Louis is about a mile. It is somewhat less at New Orleans, and still less at its principal mouth. A bar at its deepest entrance prevents ships drawing more than eighteen feet water from entering. Wild rice is not found on the waters of the Mississippi, south of the forty-first degree of north latitude; nor the Indian reed, or cane, north of the thirty-eighth. These two productions characterise the extremes of this river. It has been observed by MacKenzie, that the former is hardly known, or at least does not come to maturity, north of the fiftieth degree of north latitude. The alligator is first seen below the junction of the Arkansas. The paroquet is found as far north as the mouth of the Illinois, and flocks of paroquets have occasionally been seen as high as Chicago.

Sailing ships seldom ascend the Mississippi higher than Natchez. It is navigable for steamboats of the largest size as far as the Ohio. (See number and size of steamboats upon the Mississippi hereafter.) The passage from Cincinnati to New Orleans and back has been made in nineteen days. From New Orleans to Louisville the shortest passage has been eight days and two hours: the distance being 1650 miles, against the current. The steamboats have generally high-pressure power, and many fatal explosions have happened upon these waters. The first steam-vessel for navigating the Mississippi was built in 1810.

The following description of a flood on the Mississippi, is from the pen of the celebrated naturalist, Audubon:—

"There the overflow is astonishing; for no sooner has the water reached the upper part of the banks, than it rushes out and overspreads the whole of the neighbouring swamps, presenting an ocean overgrown with stupendous forest trees. So sudden is the calamity, that every individual, whether man or beast, has to exert his utmost ingenuity to enable him to escape from the dreaded element. The Indian quickly removes to the hills of the interior, the cattle and game swim to the different stripes of land that remain uncovered in the midst of the flood, or attempt to force their way through the waters until they perish from fatigue. Along the banks of the river the inhabitants have rafts ready made, on which they remove themselves, their cattle, and their provisions, and which they then fasten with ropes or grape vines to the larger trees, while they contemplate the melancholy spectacle presented by the current, as it carries off their houses and wood-yards piece by piece. Some who have nothing to lose, and are usually known by the name of *squatters*, take this opportunity of traversing the woods in canoes, for the purpose of procuring game, and particularly the skins of animals, such as the deer and bear, which may be converted into money.

They resort to the low ridges surrounded by the waters, and destroy thousands of deer merely for their skins, leaving the flesh to putrefy.

"The river itself, rolling its swollen waters along, presents a spectacle of the most imposing nature. Although no large vessel, unless propelled by steam, can now make its way against the current, it is seen covered by boats laden with produce, which, running out from all the smaller streams, float silently towards the city of New Orleans, their owners, meanwhile, not very well assured of finding a landing-place even there. The water is covered with yellow foam and pumice, the latter having floated from the rocky mountains of the north-west. The eddies are larger and more powerful than ever. Here and there tracts of forests are observed undermined, the trees gradually giving way, and falling into the stream. Cattle, horses, bears, and deer, are seen at times attempting to swim across the impetuous mass of foaming and boiling water; whilst here and there a vulture or an eagle is observed perched on a bloated carcass, tearing it up in pieces, as regardless of the flood as on former occasions it would have been of the numerous *sawyers* and *planters* with which the surface of the river is covered when the water is low. Even the steamer is frequently distressed. The numberless trees and logs that float along, break its paddles and retard its progress. Besides, it is on such occasions difficult to procure fuel to maintain its fires; and it is not only at very distant intervals that a wood-yard can be found which the water has not carried off.

"Following the river in your canoe, you reach those parts of the shores that are protected against the overflowing of the waters, and are called *levées*. There you find the whole population of the district at work, repairing and augmenting those artificial barriers which are several feet above the level of the fields. Every person appears to dread the opening of a *crevasse*, by which the waters may rush into his fields. In spite of all exertions, however, the *crevasse* opens, and water bursts impetuously over the plantations, and lays waste the crops which so lately were blooming in all the luxuriance of spring. It opens up a new channel, which, for aught I know to the contrary, may carry its waters even to the Mexican gulf.

"But now, kind reader, observe this great flood gradually subsiding, and again see the mighty changes which it has effected. The waters have now been carried into the distant ocean. The earth is everywhere covered by a deep deposit of muddy loam, which, in drying, splits into deep and narrow chasms, presenting a reticulated appearance, and from which, as the weather becomes warmer, disagreeable, and at times noxious, exhalations arise, and fill the lower stratum of the atmosphere, as with a dense fog. The banks of the river have almost everywhere been broken down in a greater or less degree. Large streams are now found to exist, where none were formerly to be seen, having forced their way in direct lines from the upper parts of the bends. These are, by the navigator, called *short cuts*. Some of them have proved large enough to produce a change in the navigation of the Mississippi. If I mistake not, one of these, known by the name of *Grand Cut-off*, and only a few miles in length, has diverted the river from its natural course, and has shortened it by fifty miles. The upper parts of the islands present a bulwark consisting of an enormous mass of floated trees of all kinds, which have lodged there. Large sand-banks have been completely removed by the impetuous whirls of the waters, and have been deposited in other places. Some appear quite new to the eye of the navigator, who has to mark their situation and bearings in his log-book. The trees on the margins of the banks have in many parts given way. They are seen bending over the stream, like the grounded arms of an overwhelmed army of giants. Everywhere are heard the lamentations of the farmer and planter, whilst their servants and themselves are busily employed in repairing the damages occasioned by the floods. At one *crevasse* an old ship or two, dismantled for the purpose, are sunk, to obstruct the passage opened by the still rushing waters, while new earth is brought to fill up the chasms. The squatter is seen shouldering his rifle, and making his way through the morass, in search of his lost stock, to drive the survivors home, and save the skins of the drowned. New fences have everywhere to be formed; even new houses must be erected, to save which from a like disaster, the settler places them on an elevated platform, supported by pillars made of the trunks of trees. The lands must be ploughed anew; and if the season is not too far advanced, a crop of corn and potatoes may yet be raised. But the rich prospects of the planter are blasted. The traveller is impeded in his journey, the creeks and smaller streams having broken up their banks in a degree proportionate to their size. A bank of sand which seems firm and secure, suddenly gives way beneath the traveller's horse, and the next moment the animal has sunk in the quicksand, either to the chest in front, or over the crupper behind, leaving its master in a situation not to be envied.

"Unlike the mountain torrents and small rivers of other parts of the world, the Mississippi rises but slowly during these floods, continuing for several weeks to increase at the rate of about an inch in the day. When at its height, it undergoes little fluctuation for some days, and after this subsides as slowly as it rose. The usual duration of a flood is from four to six weeks, although, on some occasions, it is protracted to two months.

"Every one knows how largely the idea of floods and cataclysms enter into the speculations of

the geologist. If the streamlets of the European continent afford illustrations of the formation of strata, how much more must the Mississippi, with its ever-shifting sandbanks, its crumbling shores, its enormous masses of drift-timber, the source of future beds of coal, its extensive and varied alluvial deposits, and its mighty mass of waters rolling sullenly along, like the flood of eternity!"

Before discussing any of the navigable tributaries of the Mississippi, we may proceed to give some account of the, in reality, main stream.

The MISSOURI has its origin, as well as some of its branches, in the Rocky mountains, and the chief source is said to rise at about a mile distant from that of one of the branches of the Columbia. The most authentic information we have yet had, of the sources of this mighty river, is from its first discoverers, Lewis and Clarke. Those travellers consider that the Missouri seems to be, in its early course, formed by three considerable branches, which unite not far from the base of the principal ranges of the Rocky mountains. To the northern they gave the name of Jefferson, to the middle Gallatin, and to the southern Maddison. All these streams flow with great velocity; their beds are formed of smooth pebble and gravel, and their waters are transparent. One hundred miles above the forks of the Missouri, are the forks of Jefferson river; two subordinate branches of which are called Wisdom and Philanthropy, one coming from the north-west, and the other from the south-east. Wisdom river is fifty yards wide, cold, rapid, and containing a third more water than the Jefferson; it drains the waters of melting snows from the mountains, but is unnavigable on account of its rapidity. One hundred and forty-eight miles further up is the extreme navigable point of the river, in north latitude forty-three degrees thirty minutes and forty-three seconds. Two miles beyond this is a small gap or narrow entrance, formed by the high mountains which recede on each side, at the head of an elevated valley, ten miles long and five broad, so as to form a spacious cove several miles in diameter. From the foot of one of the lowest of these mountains, which rises with a gentle ascent of half a mile, issues the remotest water of the Mississippi. At the source it is said that the temperature is so high that, at the end of August, water standing in vessels exposed to the night air has been frozen to the depth of a quarter of an inch.

After the junction of the three branches, the river foams onward, as a large mountain torrent. It then spreads into a broad, and comparatively, tranquil stream, full of islands. Peaks of blackish rock frown above the river in perpendicular elevations of about a thousand feet. The mountains around which it flows are covered with pines, cedars, and furs; and *mountain sheep* are seen bounding on their summits, where they are apparently inaccessible. In this distance the mountains have an aspect of wild, sombre grandeur. On the meadows and along the banks, the most common wood is the cotton-tree, which, with the willow, forms almost the exclusive growth of the Upper Missouri.

About forty-seven miles below where the Missouri gushes from the foot of the mountains into its channel through the upper plains, are the *Gates of the Rocky mountains*. In ascending the stream, it increases in rapidity, depth, and breadth, to the mouth of this formidable pass, where the rocks approach it on both sides, rising perpendicularly from the edge of the water to the height of 1200 feet. Near the base they are composed of black granite; but above, the whole are of a yellowish brown, and cream colour. Nothing can be imagined more tremendous than the frowning darkness of these rocks, which project over the river, and menace the passenger with destruction. For the space of five miles and three quarters, the rocks rise to the above degree of elevation, and the river, 350 yards broad, seems to have forced, or *sawn* its channel through the solid rocks, for nearly six miles in length; incased, as it were, during all this distance, between two walls of about 1200 feet high. During the whole of the distance the water is very deep, even at the edges; and, for the first three miles, there is not a spot, except for a few yards, on which a man could stand between the water and the towering perpendicular cliffs.

The river, for the distance of about seventeen miles, becomes almost a continued cataract. In this distance its perpendicular descent is 362 feet. The first fall is ninety-eight feet; the second, nineteen; the third, forty-seven; the fourth, twenty-six. Next to the Niagara, these falls are the most stupendous of any known in the world. The Missouri continues to rush furiously onward for a long distance beyond, but there is not much variation in its appearance until its confluence with the Platte, which river brings down vast quantities of coarse sand. The Missouri is then studded with islands. The formation of which is minutely described by Lewis and Clarke. The sand, as it has drifted down, has adhered to some of the projecting points of the shore, and formed a hard barrier of resistance to the mud, which fills up the river to the same height with the sand-bar itself. As soon as it has acquired consistency, willows grow, their roots imparting solidity to the whole: with further accumulations, the cotton-wood tree next appears, till the soil is gradually raised to a point above the highest freshets. Thus stopped in its course, the water seeks a passage elsewhere, and, as the soil on each side is light and yielding, what was only a peninsula becomes gradually an island; and the river, during the period of formation scoops additional room for its waters from the adjacent shore. In this way the Missouri, like the Mississippi, is continually cutting off the projections of the shore, and leaving its ancient channel, which may be traced by the deposits of mud, and a few stagnant ponds.

Along the whole course of the Missouri, below the Platte, the soil is described as generally fertile, and, although timber is scarce, there is still sufficient for the use of settlers. Above the Platte, although the soil is said to be rich, the

non-appearance of wood, and the want of good water, of which there is but a small quantity in the creeks, form great disadvantages in regard to its occupancy. The prairies, for many miles on each side of the river, produce abundance of good pasturage.

Above the mouth of the Osage, the immediate valley of the Missouri gradually expands, comprehending some wide bottoms, in which are many settlements, gradually increasing in the number of inhabitants. The Manito rocks, and some other precipitous cliffs, are the terminations of low ranges of hills, through which the river flows. These hills sometimes cause rapids, and opposite the Manito rocks, a group, called the Thousand Islands, stretches obliquely across the river, separated by narrow channels, in which the current is stronger than below. Some of the channels are obstructed by floating trees, which usually accumulate about the upper ends of islands, and are called *rafts*. After increasing to a certain extent, portions of these rafts become loosened, and float down the river, covering nearly its whole surface, and greatly impeding and endangering the progress of the ascending boats.

Council Bluffs, the seat of an important military establishment of the United States, about 600 miles up the Missouri, is a remarkable bank, rising abruptly from the brink of the river, to an elevation of 150 feet.

The Missouri, with its continuation down the Mississippi, is the longest river in America.* Its whole course, from its source in the Rocky mountains to the Gulf of Mexico, is 4424 miles, including its windings: nearly 4000 miles of this course is navigable. From the point of its confluence with the Mississippi to Fort Mandan, it is 1609 miles; to the foot of the rapids at Great Falls 2575 miles; 2664 to where it issues from the mountains; 2690 to the Gates of the Mountains; 3096 to the extreme navigable point of Jefferson river; and 3124 miles to its remotest source. In this immense course it receives upwards of fifty large rivers, and about 150 smaller streams. Its principal tributaries are the Roche-Jaune, or Yellowstone, the Kansas, Platte, Osage, Gasconade, Little Missouri, Running Water, Charaton, White, and Milk rivers.

The YELLOWSTONE is the largest of these tributaries. Its sources are in the Rocky mountains, near those of the Missouri and the Platte, and it may be navigated in canoes almost to its head. It runs first through a mountainous country; in many parts fertile and well timbered. It then waters a rich country, interspersed with valleys and meadows, and well supplied with wood and water, until

* "The American Fur Company have sent their steamboats *twenty-one hundred miles* above the mouth of the Missouri, and in high water, steamboats of light draft can ascend *two thousand and six hundred miles*. The Mississippi is navigable by steam between *six and seven hundred miles* above St. Louis. These rivers pass through an exceedingly fertile country; and when a just system of internal improvement shall be carried into operation, not only New Orleans and the great valley of the Mississippi will be benefited, but every portion of the United States will feel the invigorating influence of such a course."—*St. Louis Republican*.

near the Missouri it flows through open meadows and low grounds wooded on its borders. In the upper country its course is said to be very rapid, but during the two last, and largest, portions, its current is much more gentle than that of the Missouri. On the sand-bars, and along the margin of this river, grows the small-leaved willow; in the low grounds adjoining, are scattered rose bushes three or four feet high, the red-berry, service berry, and redwood. The higher plains border either immediately on the river, where they are generally timbered, and have an undergrowth like that of the low grounds, with the addition of the broad-leaved willow, gooseberry, purple currant, and honeysuckle; or they grew between the low grounds and the hills, and for the most part without wood, or any growth; except large quantities of wild hyssop, a plant which rises to the height of about two feet: like the willow of the sand-bars, it is a favourite food of the buffalo, elk, deer, grouse, porcupine, hare, and rabbit.—*Lewis and Clarke.*

The PLATTE is much more rapid than the Missouri, and drives its current to the northern bank, on which it is constantly encroaching. At some distance above the confluence, the Missouri is two miles wide, with a rapid current of ten miles an hour in some parts, the rapidity increases as it approaches the mouth of the Platte; the velocity of which, combined with the vast quantity of rolling sands which are drifting down it, into the Missouri, renders it unnavigable, except for flats or rafts, or by the Indians who pass it in small flat canoes made of hides, and the Americans who have contrived to navigate it by means of keel-boats, which, being constructed to draw but little water, and built upon a small flat keel, are remarkably well adapted for ascending rapid and shallow streams. The Platte winds its course, from west to east, for more than 800 miles.

The KANSAS is described as resembling the Missouri, with a more moderate current, and waters less turbid. Its valley, like that of the Missouri, consists of a deep and fertile soil, producing forests of cotton-wood, sycamore, and other trees, interspersed with meadows; but in the upper part the trees become more and more scattered, and at length disappear: the country around its sources spreads into an immense prairie.

The OSAGE, so called from the tribe of Indians inhabiting its banks, flows into the Missouri 133 miles above its confluence with the Mississippi. Its sources are in the Ozark mountains. Flowing along the base of the north-western slope of a mountainous range, it receives from the east several rapid tributaries. In point of magnitude this river ranks with the Cumberland and Tennessee. It has been represented as navigable for 600 miles, but this Major Long considers an exaggeration, on account of the great number of shoals and sand-bars in its current. In the lower part of its course it traverses broad and fertile bottom-lands, bearing heavy forests of sycamore and cotton-trees.

The CHARATON is seventy-five yards wide at its mouth, and navigable at high flood 150 miles. Half a mile from its confluence with the Missouri, it receives the *Little Charaton*, also a considerable stream, and navigable for many miles. The Charaton has its source near the *Des Moines* tributary of the Mississippi, and traverses a country described as of great importance, both on account of the fertility of its soil, and its inexhaustible mines of lead.

The ARKANSAS rises in the Rocky mountains, in about 42 deg. north latitude, near the sources of the Rio del Norte, on the borders of the territory of the United States and Mexico. It is about 2120 miles in length, flowing generally east-south-east. Its tributary streams are little known; they are remarkable for being deeply impregnated with salt. That part of Arkansas which traverses the Missouri territory is bordered, for the most part, by extensive prairies. Spurs of the Ozark mountains often terminate at the river. It may be remarked as singular, that to the extent of upwards of 300 miles in the lower part of the Arkansas, its valley is merely confined to the margin of the river. The soil on each side within the Missouri territory is chiefly alluvial, and where not disturbed by the floods, is verdant and fertile. The timber growing in the Arkansas country is similar to the woods of Mississippi. The Arkansas drains about 178,000 square miles of territory, and is navigable for boats about 200 miles.

On the impediments to, and dangers of, navigating the Mississippi, a writer in the *Merchants' Magazine* makes the following observations:

"In the first place, we would allude to a fact which has long been a formidable obstacle to the safe navigation of the Mississippi, as well as the cause of much individual hazard, and the sacrifice of numerous lives and a considerable amount of property. It is, perhaps, well known, that the bed and banks of the Mississippi and Missouri are, for the most part, composed of alluvial deposits of sand, the latter of which are covered with large trees. When, as is often the case, the current of the stream rises, the banks not unfrequently fall, and these trees are carried off by the stream. The sand and earthy substance adheres to the root, causing that part to sink, and to leave the tree anchored in the bed of the river. Deposits of sand are thus formed about the roots, and the obstruction thus produced frequently forces the channel in another direction. By the action of the water or the ice, the branches are worn off, leaving a stem, which sometimes projects above water, sometimes is submerged a few feet, and sometimes is so deeply buried below the surface as to be entirely concealed from sight. These obstructions, which present themselves with greater or less frequency throughout the greater portion of the bed of the Mississippi, vary in danger according to the position in which they chance to be placed. They are termed *snags*; and, coming into collision with the steamboats at midnight, or during a fog, are the source of no small discomfort to passengers—not unfrequently forcing a hole through the boat, sinking the hull, injuring the cargo, and even destroying lives.

"These obstacles most commonly occur in the bends of the rivers, or in those parts where the currents are obstructed by islands or sand-bars. Indeed, they present themselves occasionally in such numbers, that the boats are fenced in by these fallen trees, insomuch that a boat-master upon the Missouri was recently obliged to cut his way through them; and they tend to impede the navigation of that river to such an extent as to call for the attention of Congress. With that view, the chamber of commerce of the city of St. Louis have adopted vigorous proceedings in relation to the improvement of the navigation of the Mis-

Mississippi river and its principal tributaries, and also the St. Louis harbour. He who has had occasion to traverse the Mississippi, in one of the numerous steamboats which ply upon that river, may perchance have been cast in contact with one of those numerous snags which beset the stream, causing a degree of confusion, if not a damage, which it is highly desirable might be prevented. The amount of value afloat upon it, at all times during the season of navigation, and the value of the property whose fate would be probably involved in the improvement, naturally calls for some effective aid on the part of the general government. Independently of the carrying trade from the remote interior, the cotton and sugar plantations, which send their cargoes abroad from the states of Louisiana and Mississippi, Tennessee and Arkansas—the tobacco which is yearly shipped from the states of Kentucky and Tennessee, Mississippi and Illinois—together with the manufactured articles imported and exported from those states, exceeding in value that of its agricultural products, and the importance, as places of shipment, of the numerous ports upon the river—all tend to present additional claims for the aid of Congress.

“The removal of those obstructions which have so long impeded the Mississippi navigation, would seem to be a no very difficult object. The most convenient instrument for that purpose is termed a *snag-boat*, which, with its machinery, will usually remove about twenty per day; the cost of working the boat being fifty or seventy dollars, and requiring fifty men; and the expense of construction being from 25,000 dollars to 26,000 dollars. The numerous wrecks of *snagged* steamboats, which strew that noble river—the fact that freights and persons from nearly half of the union are afloat continually upon its bosom—that nearly 6,000,000 of people, residing in the bordering territory, would be benefited in greater or less degree by the improvement; and that the imports and exports of nine states and two territories, which skirt its banks, must pass along its waters, tend materially to strengthen the claims which have been urged before Congress for the improvement of its navigation. Hundreds of thousands of persons are sailing upon its surface during the season of navigation—property to the amount of millions of dollars are risked upon its waters. The merchants and manufacturers of the east are deeply interested in the subject, because the advance of freights is not less than ten per cent, in consequence of the difficulties of navigation; and the losses of insurance companies, yearly, amount to no inconsiderable sum. Moreover, not one-tenth part of the land which skirts it has been subdued to cultivation; and the bright prospects of wealth and strength that are continually unfolding, from the developing resources of the soil, are ever adding to the value and importance of the desired improvement as a merely mercantile enterprise, important from the fact that, of the total number of steamboat losses throughout the whole country, the greater proportion occur upon the Mississippi river.”

The RED RIVER is the lowest great tributary which flows into the Mississippi. Its source, or rather sources, rise at the lower range of the Rocky mountains, near Santa Fé, in Mexico. The several head branches unite into one, into which flow several tributaries, the largest of which are Blue river, and False Washita. The south bank of it forms, for a great distance, the boundary between the United States and Texas. A great part of its course is through rich prairies of a red soil; which, colouring its waters, has given this river its name. Its banks are covered with grass, and vines, which are said to yield excellent grapes. About 100 miles above Natchitoches, that great impediment to navigation, called *the Raft*, commences, over and through the alluvions and fallen trees which the waters have carried and deposited. This interruption occurs at a shallow expansion of the river to the width of twenty or thirty miles, and a length of sixty or seventy miles. In some places, the rafts covered the whole river, and had grass and willows growing on the alluvial soil collected on it, and could be even crossed

on horseback, though not without danger. But more generally the river appeared between the masses of collected timber. At a great expense, this raft has been so far removed by the United States government, that steamboats pass through it.

The following extracts from Colonel Long's report convey the most descriptive information relative to the navigation of the Red river:—

"Red river, in its course within the United States, presents a single channel of an average width of about 250 yards, and during the more elevated stages of the water has a depth sufficient for steam navigation for many hundred miles, before it reaches the northern boundary of Louisiana. But, on entering the state last mentioned, it passes into the region or district in which the rafts had their origin and existence, and is divided into numerous small channels of very considerable depth, but generally, and almost uniformly, too narrow to admit the passage of floating trees, especially when their lengths are presented transversely of any channel or bayou through which the water has to pass.

"The district constituting the region of the raft is situated entirely within the state of Louisiana. It embraces an extent from south-east to north-west, about 180 miles, and a width varying from five to twenty miles. The navigable channel through this district embraces a distance of about 500 miles. Numerous other channels, more or less devious, many of them navigable for steamboats in all stages of the water for considerable distances, are also included within this district as before intimated. The entire tract or valley now under consideration, abounds in *bayous*,* lagoons, and lakes, profusely distributed, and pervading its surface in every direction.

"The flats or bottom lands comprised within the valley, are invariably composed of a rich and fertile alluvion, of a reddish complexion and sandy consistency, and are, throughout, analogous in all respects to the alluvious formations still in progress in the same region, which are composed of a very fine sand, intermixed with ferruginous clay, the former predominating.

"The bayous are generally deep and narrow, their width seldom exceeding 150 or 200 feet. Their channels are generally bounded by abrupt sides, which are guarded against abrasions by imbedded trees, and the roots of willows and other shrubbery. The lakes are generally broad and shoal, occupying the less elevated portions of the valley. Many of them are occasionally destitute of water in a dry season. The lakes are generally studded with a growth of cypress, and sometimes with willows, cotton wood, and oak, with other upland trees, which successively thrive and decay, according to the prevalence or recess of the water at the sites occupied by them. Hence the growth and supply, in part, of materials for the formation of rafts.

"In reference to delta formations generally, we would merely observe, that the more they are enlarged the greater will be the elevation of the surface of the stream by which they are made, at any given point within the formation. For example, when the delta formation at the mouth of the Mississippi terminated at New Orleans, the surface of that river, which was then as it is now, at its mouth, on a level with the surface water of the Gulf of Mexico, was lower at that point than it is at present, by about four feet, which is the difference now existing between the surface of the Mississippi at New Orleans, in a low stage of the river, and the surface of mean tide in the gulf.

"It may, moreover, be observed, that alluvial deposits or delta formations are carried at least to the elevation of the higher freshets that have given occasion to such formations. Hence, the flats or bottom lands in the valleys of streams, generally, are approximate indications of the highest freshets that have prevailed in such streams.

"Moreover, when the alluvial lands in the valley of a river are more elevated above the low water table at one point than at another, as is strikingly the case in the valley of the Red river, we may conclude with certainty, that there is a corresponding difference in the extreme range from low to high water.

* Are channels which branch off from, often to a great distance, and afterwards join, the main stream.

"The obstructions in Red river claiming our attention, are obviously attributable to causes like those that are still operative in working changes in the character and condition of this stream. Floating trees, and other drift, are brought down by every freshet. The channels through which it has a tendency to pass are, in some places, too narrow to admit of its passage, and in others so thickly set with snags, planters, &c., that its progress downward is effectually interrupted by them. In either case the drift is arrested in its progress, and becomes stationary. A raft is thus commenced, and accumulates incessantly, so long as the drift continues to run. Every successive freshet contributes to its enlargement, by furnishing new supplies of floating materials; and in the course of a few years a raft many miles in extent is formed. The accumulations having been continued for a year or two, the materials first deposited become water-soaked and sink to the bottom of the channel, while those more recently brought down, successively follow the same example. The current of the stream, which began to be checked in its velocity, as soon as the raft began to form, is at length effectually arrested, and the water must pass off in another direction through a new *channel* or *bayou* formed for its passage. The old channel below the raft being thus blocked up, becomes a lagoon of stagnant water, and serves as a receptacle for depositions from the turbid waters of the river. Every freshet brings down a fresh supply of alluvion, with which the old channel is eventually filled, and in process of time effectually obliterated. In this way old channels become obstructed and effaced, and new ones are formed; changes of this character have been in progress, till at length the river valley presents a profusion of bayous, lagoons, lakes, and swamps, scattered in every direction.

"Since the formation of the present raft, by which the main navigable channel has been obstructed, a passage for keel-boats has been found, leading upward through Coddoo bayou, Coddoo lake, Clear lake, Black and Red bayous; at the head of which last, it again enters the main river, between twenty and thirty miles above the raft.

"Three miles below Shreveport is one of the most copious outlets anywhere to be found in connexion with the main channel. This outlet is at the head of Bayou Pierre, which conveys from the main river about two-thirds of its entire volume; a large portion of which is again restored to the main channel at Shreve's island and Cut-off, six miles below the outlet. Bayou Pierre, which vies with the main channel in the copiousness of its stream, enters Lake Wallace on the right of the river valley, and after passing through a series of lakes and bayous on that side of the valley, and occasionally washing the bases of the river hills on the same side, unites again with the main navigable channel, a little above Grand Ecore, Natchitoches, and about 100 miles, by the course of the river, below the head of the bayou.

"About midway of the distance last mentioned, or fifty miles below the head of Bayou Pierre, is another considerable outlet, in the same direction, viz., to the right, called Pascagoula bayou, which communicates with Bayou Pierre, and conveys about one-third part of the water of the main channel at the head of the bayou, from the main river to Bayou Pierre. There are numerous other outlets and bayous communicating in a similar manner with Bayou Pierre, and serving not only to reduce the volume of the main stream, but to check the speed of its current, which, in many places, does not exceed one mile and a quarter per hour, at the present stage of water. Owing to this reduction of its volume, the capacity of the main channel has been considerably reduced; so that from the head of Pascagoula bayou downward, to the mouth or inlet of Loggy bayou, embracing a distance of fifty miles, its average width does not exceed 100 feet, and the speed of its current one mile and a half per hour.

"On the left of the river, below Shreveport, are numerous small outlet bayous, which lead to, and unite with, Benoist bayou, Willow-chute, &c., all of which discharge their waters into Lake Bodcau, and through Bayou Bodcau into Lake Bastineau; all of which are situated near the river hills, by which the valley is bounded on the north-east side of the river. The waters thus congregated in the lake last mentioned, are conveyed back again to the main channel through Loggy bayou, Coshatta bayou, and other less considerable channels. By means of these successive re-augmentations, the main stream becomes more voluminous, and its current more rapid, from the mouth of Loggy bayou downward, to the mouth of Bayou Pierre, through a distance of about seventy-five miles.

"Prior to the removal of the old raft, the channel through which keel-boats were conducted past this formidable obstruction, led successively through Loggy bayou, the southern extremity of Lake Bastineau, Bayou Bodcau, Lake Bodcau, and Willow-chute; at the head of which last it united again with the present navigable channel, which was then unobstructed by the raft.

"At the present time, improvements having recently been made by the state of Louisiana in the channel of Bayou Pierre, and of the lakes connected with that stream, keel-boats are enabled to ascend through this channel, and accommodations are thus afforded to numerous inhabitants residing in its vicinity.

"From the mouth of Bayou Pierre downward, through a distance of ten miles, to the head of Bayou Bondieu, seven miles above Natchitoches, almost the entire volume of the river, both in high and low water, passes in a single channel, situated on the right of the river valley, and near the river hills on that side.

"Below the head of Bayou Bondieu, the river is divided into two considerable streams, viz., the Bondieu, and Cane or Little rivers; the former conveying at least two-thirds of the water of the entire river, having been much enlarged within a period of a few years. The first settlements on Red river, between Natchitoches and Alexandria, were made along the shores of the Cane or Little rivers; the Bondieu at that time having been an inconsiderable bayou, and totally unfit for navigation. These two streams, and the numerous bayous with which they are connected, unite their waters again, in a single channel, at the distance of sixty miles downward, as measured on the Bondieu, or ninety miles, as measured on the Cane or Little river, from the head of the Bondieu.

"From the mouth of the Bondieu downward, to Alexandria, embracing a distance of about forty miles, the water of the river passes mainly in a single channel, which is sufficiently broad, deep, and commodious, in other respects, for steamboat navigation.

"At Alexandria, the navigation is obstructed in low water by shoals and rapids, extending through a distance of about two miles, at which the aggregate fall, in a very low stage of the river, is about five feet. The obstructions at this place are occasioned by beds of very soft, probably sponaceous rock, through which it has been contemplated to cut a channel of a capacity to admit steamboats, which, no doubt, may be effected at an expense comparatively moderate.

"Below Alexandria, the river valley again presents numerous lakes, swamps, lagoons, and small bayous, but the main channel is sufficiently large and commodious to admit of the free passage of steamboats of the larger classes in all stages of the river, except at a place called the Rapiers, where the low water channel, for a short distance, is obstructed by beds, or rather *hog-back ridges* of indurated clay, which may readily be reduced, and a channel opened across them by the application of mechanical force.

"The flats or bottom lands within this part of the river valley are, for the most part, subject to inundation during the prevalence of high freshets, either in the Red or Mississippi river, and especially in the latter, the *back water* occasioned by which extends upwards in Red river, through a distance of more than 100 miles, overflowing the entire valley of the latter many miles from its mouth.

"A vast tract of country, thus subject to inundation, but otherwise of incalculable value, might probably be reclaimed, and successfully brought under cultivation, by means of a cut-off at the gorge of Tunica bend in the Mississippi, a few miles below the mouth of Red river, at which this river has to traverse a detour of more than twenty-five miles, the gorge of which is said to have an extent of only about 900 yards. By turning the river across in the direction here contemplated, the elevation of its surface at all points between the bend and Red river, and even to a much greater extent upwards, would, no doubt, be reduced sufficiently to prevent the overflow of the flat lands in the lower part of the Red river valley.

"I feel persuaded that the method of reclamation just considered is the only one by which the extensive flats alluded to can be effectually rescued from the dominion of freshets, and rendered susceptible of cultivation. The alluvion of which the Red river bottoms are composed, is not sufficiently adhesive and compact for the formation of *levees* and other embankments of a character to resist the abrasions and permeations of the water. Numerous attempts have been made to block up outlets and prevent overflows at various

points on the river, but in almost every instance they have proved ineffectual and abortive.

“ Among the remarkable anomalies presented by Red river, may be classed certain irregularities in the inundations of its extensive flats. Overflows occasionally prevail in some parts of the valley, to such an extent and duration, that the timber growth upon extensive tracts becomes deadened, and is succeeded either by a spacious pool of stagnant water, or by a growth of cotton wood, willows, vines, and other aquatic shrubbery ; while other portions of the valley of equal extent are left destitute of overflows during equal periods of time, and become fit for cultivation.

“ The river seldom or never brings down a sufficiency of water to inundate its entire valley, from the river hills on one side to those on the other, at one and the same time. The channels leading towards one side of the valley may become obstructed at their heads by rafts or otherwise, while those leading towards the other side are left open, and subject to gradual enlargement. Such being the case, the side of the valley first mentioned fails to receive its wonted supply of water, while that last mentioned receives a supply unusually large. In this way tracts that were previously dry, become and continue inundated, while other tracts previously submerged are left destitute of water, and become dry, firm, and susceptible of cultivation. The ordinary effects of submersion and desiccation will be exhibited in the vegetable products liable to be affected by changes of this nature. Among these, are the deadening of trees, by long continued immersion of their bases under water, and the springing of a dry land growth in situations from which overflows have been excluded. Under present circumstances, and owing in part to the obstructions in the main channel, occasioned by the existing raft, an unusual quantity of river water is thrown towards the right side of its valley, and causes a superabundance of water in Lake Caddo, Cross lake, Bayou Pierre, and the water-courses connected with them, which are now filled up to an extraordinary depth ; so much so, that large tracts, formerly frequented by hunters, and said to have been once inhabited by Indians, are now submersed many feet below the surface of the water.

“ On the other hand, the reverse is true with respect to the bayous and lakes situated on the other side of the valley ; the supplies of water received by which, at the present time, are far less abundant than they were formerly, and, in consequence, swamps and other tracts, previously inundated, are now partially reclaimed, and begin to produce a dry land growth of trees, shrubbery, &c.

“ Hence it results, also, that numerous bayous, leading transversely of the valley, and intercommunicating between the main navigable channel and the several lateral bayous of which we have already treated, sometimes exhibit currents of water tending towards one side of the valley, and at other times currents completely reversed and tending in the opposite direction, according to their subserviency in draining the water from an overcharged to an uncharged channel.

“ In connexion with the circumstances detailed as above, there is another worthy of particular notice in this place, viz., the fact that the date of extreme high water of any freshet occurs about two weeks earlier at the head of the region of which we have been treating, or at the outlet of Red bayou, than it does at Natchitoches ; or about three weeks earlier than at the mouth of the river ; the intervening periods being required for the diffusion of the surplus waters over the extensive lakes, lagoons, and swamps, included within this spacious district.

“ The new raft has contributed to reduce the speed of the current materially, and of course the volume of water passing in the channel. It has, at the same time, served to increase the elevation of surface water at the head of the raft, and to cause a very considerable increase in the quantity of water drawn from the main channel by Cheftel's bayou, and other outlets above.

“ The range from extreme low to extreme high water at the head of the raft, is only about five feet, which may be regarded as the ordinary range, not only on this part of the river, but generally, from the head of Red bayou downward, to that of Benoit's bayou, sixteen miles below Hurricane bluff.

“ Subsequently to the removal of the old raft, and soon after the accomplishment of that object on that part of the river above considered, the channel was again blocked up

by a second raft, which was removed in 1840 by the aid of two steamboats employed for that purpose, at an expense of about 20,000 dollars, which, it is said, has never been refunded to those who undertook the work. The channel, however, remained open but for a very short time, when the formation of the present raft commenced.

"The old raft occupied not only the distance above mentioned, viz., an extent of about thirteen miles, by the old channel upward, from Hurricane bluff, but extended downward, about thirty miles below that point, to the mouth of Caddo bayou; through which distance the channel has about the same width and depth as those above stated.

"In all other parts of the river, from Alexandria to its mouth, the channel is sufficiently broad and deep for commodious navigation, in all stages of the water. Snags, planters, and sawyers, occasionally present themselves on this part of the river, the removal of which, together with the opening of channels across the shoals above-mentioned, are the only improvements at present called for. A few detours occur, at which distances may be considerably reduced by the introduction of cut-offs. If to these we add a reduction of the elevation of surface water at the mouth of the river, as before intimated, by means of a cut-off at the gorge of Tunica bend, in the Mississippi, we have in prospect all the improvements of which the lower portions of Red river are susceptible.

"In reference to the navigable channel of Red river generally, from the southerly boundary of the state of Arkansas, to its mouth at the Mississippi, it should, moreover, be observed, that the sides and bottom of the channel, and especially the former, are more or less profusely set with snags, planters, sawyers, logs, stumps, &c., which should be removed, and of which the channel should be kept clear, in order to render the navigation safe and commodious.

"The formation of rafts in Red river is attributable mainly to two causes, viz., to the narrowness of the channels, which, in many places, have not width sufficient to admit floating trees of ordinary lengths to swing round between their sides, and to the frequent occurrence of sunken logs, snags, &c., which intercept the downward progress of such drift, which, when collected in greater or less abundance, constitute rafts. Abrupt turns in the channels give occasion also, to the formation of obstructions of this character.

"The materials of which a raft is composed for awhile remain buoyant, and are sustained at or near the surface of the water; but after being thus exposed for a year or two, become water-soaked, and sink to the bottom. In this situation a superincumbent mass of similar materials is forced upon those first brought down and arrested, till at length the channel is thoroughly choked by the successive accumulations. As the materials thus embodied decay, and the interstices between them become filled with other alluvial depositions, a growth of cotton wood, willow, and other aquatic vegetation succeeds, and all traces of the channel at the surface are eventually obliterated.

"It is obvious that a raft thus formed will remain stationary at its lower extremity, while its enlargement will be effected by an extension upward, in the direction of the channel from which it receives the materials employed in its formation.

"In this way the raft begins, and increases in depth, density, and extent, till large portions of the river, many miles in length, are effectually choked, and its waters diverted into other channels.

"Much of the old raft, as found and removed under the direction of Captain Shreve, was of the character denominated 'sunken raft,' while extensive districts of the same were of the less formidable variety called 'floating raft,' the nature and character of which have been sufficiently explained in the foregoing remarks.

"The present raft, as described in a former part of this paper, is of the description last mentioned, viz., floating raft. The timber and other materials of which it is composed, are yet buoyant, and admit the water to pass with much freedom beneath them.

"With regard to the difficulty and expense of removing these two varieties of rafts, it is obvious that the cost of removing the sunken raft is incomparably greater than that attendant upon the removal of a floating raft.

"We shall now attempt a very brief description of the machinery proper to be employed in the removal of rafts and other obstructions prevailing in Red river, and of the manner of operating upon them.

"The machinery and other apparatus hitherto employed in operations upon the raft, were, for the most part, devised by Captain Shreve, and consist principally of a steamer, called a snag boat, of remarkable strength, furnished with a very powerful wheel and windlass, and a great variety of chains, warps, and other cordage, of different sizes and powers; also, of machine boats of very inferior dimensions and strength, for raising and cutting logs, snags, &c., of small sizes, which are also furnished with windlasses of the requisite strength. The windlass and other machinery of the snag-boat, as well as the boat itself, are worked by steam power, while those of the machine boats are worked by hand. In attendance upon the boats above mentioned were a keel-boat, which served as quarters for the labourers employed on the work, and skiffs or other small boats for their conveyance from one point to another. The tools and implements required for the service, and kept among the apparatus of the boats, consisted principally of cross-cut and other saws, axes, shovels, spades, mattocks, blacksmiths' tools, &c., besides cooking stoves and other culinary apparatus.

"The force required to man a snag-boat, should consist of a captain, mate, pilot, steam engineer, blacksmith, four firemen, ten labourers, and a cook, in all twenty persons. The force may be increased by the addition of more labourers, according to the nature of the service, to twenty-five or thirty.

"The force required on a machine-boat may consist of six to ten hands, four of whom should be expert watermen.

"In addition to the cordage required for actual operation with the boats, an extra supply adequate to the exigencies of a year's service should be stored on board of the boats, the cost of which may be estimated at 500 dollars.

"The manner of operating upon a floating raft, consists in first running the snag-boat forcibly against the drift at its lower extremity, the boat being propelled by the full force of its steam-power. This operation serves to loosen the logs and other materials of which this part of the raft is composed. When sufficiently loosened in this way, warps are carried forward and applied to one or more of the largest logs or trees in the vicinity of the boat, and some hundreds of feet ahead of it, when the boat is backed by its full steam-power, and a portion of the raft withdrawn. The logs, &c., thus dragged out, are taken up successively by the machine boats (or by the snag-boat, which is furnished with apparatus for this purpose), and reduced to pieces, twelve to thirty feet in length, by chopping with axes or cutting with saws. Thus reduced, the materials are thrown into the river and conveyed away by its current. Pieces having the roots of the trees from which they sprung attached to them, should not be longer than the shortest length just mentioned, and instead of being thrown back again into the channel, where they would be likely to be converted into planters of a formidable character, should be thrown on shore, or conveyed into bayous or pools more or less remote from the navigable channel. Having thus broken up and removed a portion of the raft, successive portions of the same are reduced and withdrawn in the same manner till the whole is removed.

"The method of operating on a sunken raft differs considerably from that above described. The snag-boat is brought up to the foot of the raft; her windlass chain, which is very stout and strong, is attached to some one of the largest trees in the lower part of the raft, the tree selected for this purpose being partially imbedded in the bottom or sides of the channel, after the manner of a snag. The windlass is then put in operation by the agency of one of the steam-engines of the boat. The tree is now wrested from its moorings and dragged upon the roller-ways of the boat, where it is divided by saws or otherwise into the lengths before-mentioned, and disposed of in the same manner. The eradication of the tree by this process, serves to loosen a greater or less quantity of the materials of the raft, which are taken up and reduced to pieces as before, and then turned adrift, or removed from the channel and conveyed into pools or bayous or thrown on shore.

"As an example of the progress made in the removal of a raft, part of which was sunken, I have been credibly informed that an extent of more than a mile of compact raft was removed by fifty-six men in fifteen days.

"In case a snag or sawyer of large size has to be removed, the snag-boat is brought up to it in a manner to thrust its inclined plane or lift under the end of the snag, as pre-

sented above the surface of the water, thus lifting the snag partially into the boat. The windlass chain is then applied to the main part of the trunk of the snag, as near to its root as practicable, and the entire snag is dragged into the boat, deposited on its roller-ways, reduced to pieces, and disposed of as before.

"When a planter (the trunk of a tree standing perpendicularly in the water, with its roots more or less firmly imbedded in the alluvion at the bottom of the stream) is to be operated upon, the snag-boat is made to run with its full speed and momentum against the obstruction, and to repeat this operation, striking the planter in different directions, till it is effectually loosened to its roots. The windlass chain is then applied, the planter lifted out of the water and deposited on the rollers of the boat, after which it is cut into pieces and disposed of as before.*

"Logs more or less deeply imbedded in the deposits of the river, are grappled, raised, and disposed of in the same manner.

"The snag-boat is occasionally employed as a tow-boat to drag the materials of a reduced raft from the channel, and force them into bayous or pools, or to deposit them on shore.

"Other operations, having for their object the improvement of the river, are of the following character and import, and may be effected in the following manner :

"A cut-off leading across the gorge or bend or detour of a channel, is effected by excavating a new channel, eight to ten, or twelve feet wide, and to the depth of three or four feet below the high water surface of the river; the depth in all cases being sufficient to penetrate through the soil and below the roots of all trees and other vegetable products springing from it. Thus begun, the cut-off is completed by the abrasion of the current spontaneously produced in the excavated channel by subsequent freshets, one of which is sometimes sufficient to complete the operation.

"In order to prevent the formation of a raft or the creation of other obstructions at or below the point of a contemplated cut-off, the trees, &c., standing upon the ground to be occupied by it should be felled and cut into pieces prior to the formation of the cut-off.

"Short turns or crooks in the channel may be rendered less abrupt, and more safe and easy of navigation, by reducing the protruding points around which the channel passes. This operation is to be effected by cutting the trees and bushes from the points, extracting any logs contained in them, and loosening the earth of which they are composed, till the obstruction is sufficiently demolished, and its component parts swept away by the current.

"In order to guard against the formation of new rafts, it has been deemed advisable to fell and reduce to pieces, in the manner before mentioned, all trees and saplings standing on the banks of the river, and within their respective lengths of its margin. This operation I should deem advisable and expedient, so far as it relates to the cutting of trees, &c., standing upon or near concave shores, and of all trees and shrubbery overhanging the channel. This operation, however, should never be extended to the removal of bushes and other undergrowth, at or near the margin of the river. On the contrary, an abundant growth of young willows, cotton-wood, vines, and shrubbery of all kinds, should be encouraged and promoted as much as possible on the alluvious shores of the river, as the best means of protecting the banks from the abrasions and detritions occasioned by the current.

"In addition to the methods of improvement presented in the foregoing details, two others have been suggested, neither of which can I regard as effectual, for reasons already assigned. The methods alluded to are those of closing the principal outlets from the main navigable channel by dams at their heads, and of erecting levees along the sides of the main stream, to prevent overflows and extravasations of its water; the former having already proved ineffectual at several points, and the latter, though not yet fully tested, being obviously of doubtful efficacy, if not entirely subversive of any beneficial results.

* As a remarkable example of the difficulties of these operations, Captain Cooper, commanding the snag-boat *Archimedes*, reported that he attacked a sycamore planter, seven feet in diameter, standing in the channel of the Missouri river near a sand-bar, and so situated that the snag-boat could be brought to act upon it from below and on one side only; and that the planter withstood more than 100 shocks from the full power and momentum of the boat without any appearance of yielding; after which it was effectually loosened and entirely eradicated.

“ Whatever the mode of improvement, care should be taken, as well to prevent too large a portion of the water of the river from flowing in the improved channel, as to prevent too great a reduction of its volume, and to ensure the requisite supply. The former of these evils will be likely to result from the erection of dams and levees for the purposes in question, should such structures prove stable and effectual; while it is believed that the latter may be effectually guarded against by keeping the channel open, reducing its distances by means of cut-offs, and thereby enlarging its capacity, and increasing the speed of its current.

“ There is still another species of improvement deemed desirable and necessary by some, but which I regard as unadvisable under existing circumstances. The mode here adverted to contemplates a widening of the channel in various parts of the river, embracing an extent of several miles in each, in many instances, which cannot be effected without an expenditure vastly greater than the amount of the present appropriation.

“ If the channel, as it now exists, is cleared of all its obstructions, and kept free of snags, lodgments of drift, and other impediments of a character to impede the velocity of the current, and if effectual measures are taken to accelerate the current in places where it is at present too sluggish, the obvious and certain result will be gradual enlargement of the channel and its volume, which will be brought about by the abrasion of the sides of the channel by currents of water, rains, frosts, and other atmospheric changes, and by the decay of logs and other perishable materials imbedded in the banks; a result which is exemplified in numerous bayous connected with the lower portions of the river, from which drifting materials have been for a long time excluded, and in which a lively current has prevailed.

“ In discussing the improvements of the river, there is still another consideration worthy of particular notice. The growth of willows and other shrubbery, vines, &c., along the shores, and near the water edges, as also the growth of young cotton woods, bushes, and other furze upon the river banks, should be permitted to remain. The alluvion of the banks being held together and confined by the roots of these vegetable products, is the better enabled to withstand the abrasion of currents, and, in consequence, the channel is kept narrower, deeper, and hitherto almost entirely exempt from shoals and sand-bars. In several instances, where the surface of the ground has been cleared to the water's edge, there begin to be strong indications of an enlargement in the width of the channel, and of the commencement of shoals, occasioned by the formation of bars. Any changes in the river having a tendency to generate obstructions of this character, should be carefully guarded against.”

The **WASHITA**, a tributary, which flows into Red river, is navigable for many miles. Its course, within the valley of the Mississippi, called Black river, is navigated by large boats. **WHITE RIVER**, which flows into the Mississippi a little above the Arkansas, is navigable at a moderate flood of water between 300 and 400 miles. Of the rivers tributary to the Missouri, it is remarkable, that their mouths are generally blocked up with mud, after the subsiding of the summer freshet of that river, which usually takes place in the month of July. The freshets of the more southerly tributaries are exhausted earlier in the season, and wash from their mouths the sand and mud previously deposited therein, leaving them free from obstructions. These freshets having subsided, the more northerly branches discharge their floods, formed by the melting of the snow, at a later period. The Missouri being thus swollen, the mud of its waters is driven up the mouth of its tributaries. These streams having no more freshets to expel the accumulation, their mouths remain thus obstructed till the ensuing spring.—*Long's Travels.*

The *St. Peter*, a tributary of the Mississippi, has its rise in a small lake about three miles in circumference, at the base of a ridge, named *Coteau des Prairies*. It enters the Mississippi nine miles below the Falls of *St. Anthony*. Its length in all its windings is about 500 miles. Its course is exceedingly serpentine, and is interrupted by several rocky ridges, extending across the bed of the river, and occasioning falls of considerable descent. During the times of spring freshets and floods, this river is navigable for boats from its mouth to the head of *Big Stone lake*, about fifteen miles from its sources. For a distance of about forty miles on the lower part of the river, it is only from sixty to eighty yards wide, and navigable for pirogues and canoes in all stages of the floods; higher up, its navigation is obstructed in low water by numerous shoals and rapids. The aggregate descent of the *St. Peter* may be estimated at about 150 feet, the general level of the country at its source having an elevation of about fifty feet above the river. The chief of its tributaries is the *Blue-earth river*, which flows in from the south 100 miles west of the Mississippi by a mouth fifty yards in width. It is chiefly noted for the blue clay which the Indians procure upon its banks, and which is much employed in painting their faces and other parts of their bodies. The river *St. Peter's* enters the Mississippi behind a large island, which is probably three miles in circumference, and is covered with the most luxuriant growth of sugar-maple, elm, ash, oak, and walnut. At the point of embouchure, it is 150 yards in width, with a depth of ten or fifteen feet. Its waters are transparent, and present a light blue tint on looking upon the stream. From this circumstance, the Indians have given it the name of *Clear-water river*.—*Book of United States*.

The *RED RIVER* of the north rises near the sources of the *St. Peter's*; and by a northern and winding course runs nearly 200 miles within the United States limits; and then passes into the British dominions of Upper Canada, and empties into *Lake Winnepeck*. Its principal branches are *Red Lake river* and *Moose river*: the latter of which streams rises within a mile of *Fort Mandan* on the *Missouri*. *Red river* is a broad, deep, and navigable stream, abounding with fish, and the country along its banks with elk and buffaloes.

The *OHIO*.—The name *Ohio* is said to signify in the language of the aborigines, "the beautiful river." Above *Pittsburg* it is called the *Alleghany*: the source of which is in *Pennsylvania*, in north latitude forty-one degrees and forty-five minutes, and west longitude seventy-eight degrees. It is formed by two small streams. At *Pittsburg*, where the *Alleghany* receives the *Monongahela*, the main stream is there called the *Ohio*. The *Monongahela* is formed by the confluence of two streams, both rising in the *Alleghany chain*, in the north-west angle of *Virginia*, and running parallel to each other for sixty miles in nearly a direct line. The absolute course of the *Monongahela* is more than 200 miles, but not above 130 in a direct line from south to north. It appears to be a larger and deeper stream at *Pittsburg* than the

Alleghany, which, in the dry season, has not above seven feet water, where deepest. The waters of the Alleghany are always clear and limpid, while those of the Monongahela, on the contrary, become muddy and turbid, whenever there are a few days of successive rain in that part of the Alleghany mountains where it rises. Each of the streams is about 400 yards wide at their confluence, and after the junction, the stream is more remarkable for its depth than breadth.

The OHIO, formed by the junction of the Monongahela and Alleghany, appears to be rather a continuation of the former than the latter, which arrives at the confluence in an oblique direction. From Pittsburg to the mouth of the Ohio, the distance is 1033 miles, following the stream. It receives numerous tributaries on both sides, in its course to the Mississippi. For 300 miles below Pittsburg, the Ohio runs between two ridges of hills, rising from 300 feet to 400 feet in height. These are frequently undulated along their summits, and extend occasionally as elevated table lands. They sometimes recede from, and sometimes approach to, the banks of the river; generally run parallel to the Alleghany chain. These ridges recede gradually as we proceed down the river, and finally disappear from the view. The Ohio flows through a transverse chain, at the rapids, near Louisville, and thence through a level country, as far as the Mississippi. The general appearance of this picturesque river is placid, gentle, and transparent, except during the floods. There are periodical inundations in winter and in spring. The vernal inundations of the Ohio commence sometimes at the end of March, and subside in July; and sometimes early in February, and subside in May. The inundations are early or late, according to the melting of the snows or the ice in the interior. The Ohio, during these inundations, is swelled to a remarkable height, varying in different places, as the river is more or less expanded in breadth. The high and steep banks, in the upper course of the Ohio, prevent the general level of the land from being overflowed, and rendered marshy and unwholesome, as in the Lower Missouri, and in the lower part of the Ohio. Yet high as its banks are, the Ohio is sometimes destructive to the towns which are not sufficiently elevated above the river. Part of the town of Marietta situated at the junction of the Muskingum with the Ohio, though elevated forty-five feet above the ordinary level of the stream, has been twice inundated, and abandoned by the inhabitants. The town of Portsmouth, at the mouth of the Great Sciota, 218 miles below Marietta by water, though elevated sixty feet above the usual surface of the river, has been also subjected to a similar calamity. At Cincinnati, the breadth of the river is 535 yards, and the banks fifty feet in perpendicular height, yet these are annually overflowed. The winter floods commence in the middle of October, and continue to the latter end of December. Occasionally, during summer, heavy rains fall among the Alleghany mountains, by which the Ohio is suddenly raised; these summer inundations are rare. During the two periodical floods, which, taken

together, last for nearly half the year, vessels drawing about twelve feet water navigate the river downward from Pittsburg to New Orleans, a distance of nearly 2200 miles. The voyage from Pittsburg to the falls may be accomplished in nine or ten days, but it is generally performed in twelve days. The difficulty of navigating the Ohio during the dry season, is limited to the upper part of its course, or between Pittsburg and Limestone: a distance, by water, of 425 miles. The shallowness of the stream is occasioned by its being divided by islands into several channels; for the depth of the Monongahela branch of the Ohio alone, is twelve feet, at Pittsburg. Michaux counted fifty of these islands in the distance of 390 miles; some of them only containing a few acres, and others exceeding a mile in length. A ship, of above 300 tons, called the *Muskingum*, arrived at the port of Liverpool, in the United Kingdom, in May, 1845, on her first voyage from Cincinnati. This vessel was built at Marietta, 283 miles above Cincinnati, with a cargo of pork, lard, oil-cake, &c., laden at the latter place. This ship performed the voyage from where built to the Gulf of Mexico, 1933 miles, and thence round Florida, by the Bahama channel, across the Atlantic, more than 5000 miles, or in all, about 7000 miles to Liverpool.

The *TENNESSEE* rises in the Alleghany mountains, traverses East Tennessee, and almost the whole northern limit of Alabama, re-enters Tennessee, crosses almost the whole width of it, into Kentucky, and passes into Ohio, fifty-seven miles above its junction with the Mississippi. It is near 1200 miles in length, and is the largest tributary of the Ohio. It has numerous branches, and is navigable for boats for about 1000 miles. Most of its branches rise among the mountains, and are too shallow for navigation, except during the floods, which take place occasionally, at all seasons of the year, and allow flat boats to be floated down to the main stream. The Muscle shoals are about 300 miles from its entrance into the Ohio. At this place the river spreads to the width of three miles, and forms a number of islands. The passage by boats is difficult and dangerous, except when the water is high.

From these shoals to the place called the *Whirl*, or *Suck*, 250 miles, the navigation all the way is excellent, to the Cumberland mountain; which the river flows through. This mountain is, in parts, so steep, that even the Indians cannot ascend it on foot. In one place, particularly near the summit of the mountain, there is a remarkable ledge of rocks, about thirty miles in length, and 200 feet high, with a perpendicular front facing the south-east, forming a magnificent wall, excelling all the artificial fortifications in the known world. The Whirl is considered a greater curiosity than the famous breach by the river Potomac through the Blue Ridge.

The Tennessee, which above the Whirl is half a mile wide, contracts to a breadth of about 100 yards, or eighteen rods. A large rock which projects

from the northern shore, in an oblique direction, renders the channel still narrower, and causes a sudden bend, by which the waters are thrown with great force against the opposite shore. From thence they rebound, and form a whirl of about eighty yards, or 240 feet in circumference. By the dexterity of the rowers, canoes drawn into this whirl have sometimes escaped without damage. In less than a mile below the whirl, the river spreads to its common width down to Muscle shoals; and thence flows in a regular and majestic stream down, to its confluence with the Ohio.

The **WABASH** rises in the north-eastern part of Indiana, and flows south-westerly across the state, then it bends to the south, and flows into the Ohio, forming towards its mouth the western state boundary. Its length, from its source to its mouth, exceeds 500 miles. It is navigable for keel-boats, about 400 miles, to Ouitanon, where there are rapids. From this village small boats proceed to within six miles of St. Mary's river; ten of Fort Wayne; and eight of the St. Joseph of the Miami-of-the-lakes. Its current flows gently above Vincennes; below the town there are several rapids, but not of sufficient force to prevent boats from ascending. The principal rapids are between Deche and White rivers, ten miles below Vincennes. White river and Tippecanoe river are branches of the Wabash.

The **CUMBERLAND** rises in the Cumberland mountains, Kentucky, and, flowing nearly 200 miles through that state, passes into Tennessee, through which it makes a circuit of 250 miles, then re-enters Kentucky, and falls into the Ohio, about fifty miles above the confluence of that river with the Mississippi. From the source of this river to its junction with the Ohio, the distance in a direct line is 300 miles; and by the course and windings of the stream, nearly 600 miles; for 500 of which it is navigable for batteaux of fourteen or fifteen tons burden.

The **MUSKINGUM** rises in the north-eastern part of Ohio, and flows southerly into the Ohio river. It is about 200 miles in length, and is navigable for boats for about 100 miles. It is connected by a canal with Lake Erie. The *Sciota* rises in the western part, and flows southerly into the Ohio. It is about 200 miles long, and is navigable 130 miles. There are rich and beautiful prairies along the river, and its valley is wide and fertile. A canal passes along this valley, and extends north-easterly to Lake Erie. The *Licking* and *Kentucky* rivers take their rise in the Cumberland mountains, and flow north-westerly into the Ohio. They are each about 200 miles in length. The latter is navigable for 150 miles, and has a width of 150 yards at its mouth. The current is rapid, and the shores are high. For a great part of its course, it flows between perpendicular cliffs of limestone. While sailing down this stream the passenger is said to experience an indescribable sensation on looking upwards from the deep chasm bounded

closely by these lofty parapets. Among the other tributaries of the Ohio, are the Great and Little Miami, Saline,* Green river, Big Sandy, Kanhawa.

The ILLINOIS rises in the north-eastern parts of the state of that name, no more than thirty-five miles from the south-western extremity of Lake Michigan and communicating by locks through a morass with the River Chicago, which empties into that lake. Its two main head-branches are Plein and Kankakee. Thirty miles from the junction of these rivers, Fox river flows in from the north. The Vermilion is a considerable stream, which joins the Illinois from the south, 260 miles above the Mississippi. Not far below the Vermilion and 210 miles above the Mississippi, is the commencement of Peoria lake—an enlargement of the river, two miles wide, on an average, and twenty miles in length. This picturesque expansion is so deep that its current is not perceptible. Its romantic shores, are generally bounded by prairies. It abounds with fish.

On the north side of the Illinois, the rivers that flow in-shore have their courses, for the most part, in mountainous bluffs, which often approach near the river. For a great distance above its mouth, the river is almost as straight as a canal. In summer it has scarcely a perceptible current; and the water, though transparent, has a marshy taste which renders it almost unfit for use. The river is wide and deep; and, for the greater part of its width, is so thickly filled with aquatic weeds, that no person could swim among them. Only a few yards' width, in the centre of the stream, is free from these weeds. It enters the Mississippi through a deep forest, by a mouth 100 yards wide. Probably no river of the western country is so well adapted for boat navigation, or waters a more luxuriant country.

ROCK RIVER is one of the most beautiful tributaries of the Mississippi. It has its source beyond the northern limits of Illinois, in a ridge of hills that separates the waters of the Mississippi and those of Lake Michigan. On its banks are extensive and rich lead mines. Its general course is south-west, and it enters the Mississippi, not far above the commencement of the military bounty lands. Opposite the mouth of this river, rises in the Mississippi, a beautiful island, on which there is a military station.

KASKASKIA RIVER rises in the interior of Illinois, near Lake Michigan. It flows in a south-west direction nearly 300 miles: for the greater part of which, during the moderate and higher floods it is navigated by boats. It flows through a fertile and settled country, and joins to the Mississippi a few miles below the town of the same name.

The WISCONSIN is the largest river of the North-West territory that flows into the Mississippi. It rises in the northern interior of the country, and near the Montreal of Lake Superior. It flows between 300 and 400 miles, with a

* On the banks of this stream, about twenty miles from the Ohio, are extensive salt-works owned by the United States government.

shallow and rapid current, navigable by boats during the floods. It is about 800 yards wide at its mouth. There is a portage of only half a mile between this and Fox river, by which Father Marquette first passed on his way to discover the Mississippi. It is over a level prairie, across which, from river to river, there is a water communication for periogues in high stages of the water. *Fox river* flows through Winnebago lake. Its length is about 200 miles. The country along its banks is fertile, with a salubrious climate. *Chippeway* is a considerable branch of the Mississippi, which it joins just below Lake Pepin. It is half a mile wide at its mouth, and has communications by a short portage with Lake Superior. The other chief rivers of this territory, tributary to the Mississippi, are the St. Croix, Rum, St. Francis, and Savannah.

Among the smaller tributaries to the Mississippi are the Obian, Forked Deer, Big Hatchet, and Wolf rivers, all of which flow into it from Tennessee; and the Yazoo and Big Black, from the state of Mississippi. The last named rivers are only navigable for boats.

Besides the rivers which flow into the Mississippi, there are a few small streams which flow directly into the Gulf of Mexico. The *Alabama river* rises in the mountainous parts of Georgia, in two head-streams named the Coosa and Tallapoosa, and running south-westerly through the centre of the state of Alabama, unite with the Tombeckbee; both the streams then take the name of Mobile, and, flowing south for a short distance, fall into Mobile bay.

RIVERS OF BRITISH AMERICA.

The British dominions in North America are intersected with numerous rivers, which, great and small, extend over them the most convenient navigable advantages. The provinces of Nova Scotia and New Brunswick, the islands of Prince Edward and Cape Breton, are, as will be observed by a reference to any modern map, watered by navigable rivers, lakes, and arms of the sea.

The River St. John, and its tributaries, and several bays branching from it; the rivers Peticoudiac and Mirimachi, open a magnificent inland navigation through the interior of New Brunswick. In Lower Canada, several rivers falling into the St. Lawrence, and the Rustigouche into the Bay de Chaleur, are navigable for small vessels.

The **ST. LAWRENCE**, or *Great River of Canada*, after flowing through Lakes Superior, Huron, Erie, and Ontario, and through the key of the Thousand Island, is rendered navigable, by cuts and canals, to Montreal, and to the Ottawa, by the Rideau Canal.

The **THAMES**, the **OUSE**, or Grand River, and some other streams falling into the St. Lawrence, are either naturally, or rendered artificially, navigable. The **WELLAND CANAL** is rendered navigable by sailing vessels of considerable burden, from Lake Erie to Ontario, and surmounts the otherwise impassable Niagara. Opening, by canal, a navigation projected from Lake Ontario by way of Lake

Simcoe to Lake Huron would complete an internal navigation of incalculable benefit to Upper Canada.

The OTTAWA, or Great North river, although its navigation is in some places rendered difficult by rapids, opens a rich and extensive region which has been rapidly settled upon, and from which great quantities of timber are rafted down to Montreal. (See Trade of Canada.)

Large and small ships ascend from all parts of the world by the gulf, estuary, and River St. Lawrence, to Quebec and Montreal. Numerous steamboats, and various kinds of river and coasting vessels, are (except during winter, when all is locked up in ice) perpetually navigating the waters of the rivers and lakes of Canada.

The SAGHUNY, a river so mighty that it is asserted to discharge as great a quantity of fresh water as the great St. Lawrence, falls into the latter from the north, about 100 miles below Quebec. It is remarkably deep, and large ships ascend it more than sixty miles, to be laden with deals and timber, prepared in the woods, or sawn at the saw-mills, which have been erected. The navigation of its upper course, flowing into Lake St. John, and its flood out of that lake, is interrupted by rapids: appearing, however, to be navigable as high as its soil can afford products for markets. Settlements have been formed, and wheat and various other crops are cultivated on its low lands, but not near its precipitous banks.

Having thus briefly described the extent of river navigation, and, in a previous part, the extent of lake navigation, we will now sketch the progress and extent of water communication by canals.

CHAPTER XIV.

CANALS AND RAILROADS OF THE UNITED STATES.

THE first canals in Europe were constructed in Italy, and to a far greater extent in Holland. England had no canal until 1760, when the enterprising Duke of Bridgewater succeeded in an undertaking which was at the time considered an act of wrong-headed indiscretion.

The first attempt to construct canals, unless it were by small cuts from the Mohawk river, in the United States, was the Middlesex canal, in Massachusetts, completed in 1804; and in Pennsylvania, in 1791 and 1792, when the Schuylkill and Susquehanna companies were incorporated for the purpose of opening a water communication between the Susquehanna and the great lakes. Four to five hundred thousand dollars were expended by these companies; but subscriptions failed, and, in 1795-6, the works were abandoned.

The great canal of America is that which has opened a water communication between the River Hudson and Lake Erie. Connecting by water the great lakes with the Atlantic, is said to have been first conceived by a man, of whom the state of New York is justly proud—Gouverneur Morris.

The surveyor-general of the state, De Witt, the governor, De Witt Clinton, and others, entertained the project, with the full conviction of its practicability; and, with this view, in 1808, the legislature of New York ordered surveys, to ascertain the most practicable line, to be made. In 1810, Gouverneur Morris, Stephen Van Rensselaer, De Witt Clinton, Simeon De Witt, William North, Thomas Eddy, and Peter B. Porter, were appointed commissioners for that purpose; the names of Robert R. Livingston and Robert Fulton were added in 1811.

In pursuance of their instructions from the New York legislature, they applied to Congress, and to some of the other states; and the project was treated with ridicule, and as impracticable. But they were men not to be discouraged; and their report to the legislature, in 1812, is remarkable for intelligence, judgment, and forecast. They boldly, after calculating the estimated expense, predicted that the tolls would amply repay the state expenditure. This report states that—

“It is impossible to ascertain, and it is difficult to imagine, how much toll would be collected. The amount of transportation might be estimated, by subjecting probabilities to calculation. But, like our advance in numbers and wealth, calculation outruns fancy. Things, which twenty years ago any man would have been laughed at for believing, we now see.

“At that time the most ardent mind, proceeding on established facts, by the unerring rule of arithmetic, was obliged to drop the pen at results, which imagination could not embrace. Under circumstances of this sort, there can be no doubt that those *microcosmic minds, which, habitually occupied in the consideration of what is little, are incapable of discerning what is great*; and who already stigmatised the proposed canal as a romantic scheme, will not unsparingly distribute the epithets, absurd, ridiculous, chimerical, on the estimate of what it may produce. The commissioners must, nevertheless, have the hardihood to brave the sneers and sarcasms of men, who, with too much pride to study, and too much wit to think, undervalue what they do not understand, and condemn what they cannot comprehend.

“Viewing,” the commissioners add, “the extent and fertility of the country with which this canal is to open a communication, it is not extravagant to suppose, that when settled, its produce will equal the *present export of the Atlantic States*; because it contains more land, and that land of a superior quality.”

The commissioners, after stating certain facts as the ground of their estimate, say—

“Standing on such facts, is it extravagant to believe that New York may look forward to the receipt (at no distant day) of *one million of dollars net revenue* from this canal? The life of an individual is short. The time is not distant when those who make this report will have passed away. But no time is fixed to the existence of a state; and the first wish of a patriot’s heart is, that his may be immortal.

“But whatever limit may have been assigned to the duration of New York, by those eternal decrees which established the heavens and the earth, it is hardly to be expected that she will be blotted from the list of political societies, before the effects here stated shall have been sensibly felt. And even when, by the flow of that perpetual stream which bears all human institutions away, the constitution shall be dissolved, and our laws be lost, still the mountains will stand, the same rivers run. New moral combinations will be formed on the old physical foundations, and the extended line of remote posterity, after a lapse of 10,000 years, and the repeated revolutions, when the records of history shall have been obliterated, and the tongue of tradition have converted (as in China) the shadowy remembrance of ancient events, into childish tales of miracle, this *national work* shall remain. It

shall bear testimony to the genius, the learning, the industry, and intelligence of the present age."

Gouverneur Morris may proudly claim the honour of projecting this great undertaking. To De Witt Clinton is certainly due the credit of its execution. In conjunction with his able colleagues, he persevered against a powerfully combined opposition of party, of prejudice, and of ignorance. The war between the United States and Great Britain, which broke out soon after the presentation of their report, prevented the commencement of operations on the line projected for the canal until 1817. On the 4th day of July of that year, the first excavation was made, and the canal was completed in October, 1825, at an expense of 9,027,456 dollars. In October, 1817, a canal, connecting the waters of Lake Champlain with the Erie canal, nine miles from Albany, a distance of sixty-three miles, was commenced, and finished at the close of 1823, at an expense of 1,179,871 dollars.

In eight years, a period far short of the most sanguine expectation of the commissioners, and contrary to the ignorant and prejudiced opinions of the public, the tolls exceeded the estimated returns.

Before proceeding to an account of the canals of each particular state, we will introduce a brief view of the railroads.

RAILROADS OF THE UNITED STATES.—The first attempts to construct railroads were made in 1828. Tramroads were made previously for the transportation of coal, stone, and other heavy articles.

In 1832, the following railways were constructed and in operation :

Baltimore and Ohio	60 miles completed and in use.
Charleston and Hamburg	20 " "
Albany and Schenectady	12 " "
Maunch Chunk	9 " "
Quincy, near Boston	6 " "

There were ninety-two miles in use upon the main lines of railroads.

There were in full operation in the United States, during the year 1837, fifty-seven railways, whose aggregate length exceeded 1600 miles, and that thirty-three others were in progress. Some of these works, it is well known, are owned by individuals by virtue of charters from the states through which they pass, and others are owned in the whole, or in part, by the states themselves. More than 150 railway companies had then been incorporated. Different plans, however, seem to have been adopted in the mode of their construction, proceeding as they have done, from separate legislatures and states widely separated, and possessing different kinds of soil suited to their tracks. Mr. David Stevenson, to whom we have before alluded, states "that here no two railroads are constructed alike. The fish-bellied rails of some, weighing forty pounds per lineal yard, rest upon cast iron chains, weighing sixteen pounds each; in others, plate rails and malleable iron, two and a half inches broad, and half an inch thick, are fixed by iron spikes to wooden rafters, which rest upon wooden sleepers; in others, a plate rail is spiked down to treenails of oak or locust wood, driven into jumper holes bored in the stone curb; in others, longitudinal wooden runners, one foot in breadth, and from three to four inches in thickness, are imbedded in broken stone or gravel; on these runners are placed transverse sleepers, formed of round timber with the bark left on; and wrought iron nails are fixed to the sleepers by long spikes, the heads of which are countersunk in the rail: in others, round piles of timber, about twelve inches in diameter, are driven into the ground as far as they will go, about three feet apart; the tops are then cross-cut, and the rails spiked to them."

TABLE of the principal Railways in operation in the United States, in 1840.

NAME.	COURSE.	When opened.	Length in Miles.	Whole length in each State.	NAME.	COURSE.	When opened.	Length in Miles.	Whole length in each State.

The following extracts, illustrative of the railway system of the United States, are compressed from an able article on the subject by Mr. J. H. Lanman.

"If we survey the map of the United States, we shall find that the termini of these lines, at both ends, rest at the principal commercial towns of the country, both in the east and west. The principal termini of each track upon the Atlantic seaboard may be found in Boston, New York, Philadelphia, Norfolk, Wilmington, Charleston, and Savannah. From these grand points of shipment, the railroad tracks run across the interior, and intersecting in their course the most prominent villages or cities, terminate at the grand marts of western commerce, and the shores of their navigable waters.

"Passing by the routes which have been laid out in the British provinces, commencing at Quebec, and running across the English and American territory, designed as they are to connect the river St. Lawrence with the ocean, and the railroad already constructed from Orono to Belfast, in the state of Maine, we proceed at once to describe the grand tracks which have already been laid out, and some of them completed, along the Atlantic seaboard, and diverging across the republic to the interior of the west. And, in the first place, it is clear that population, production, and commerce, are the three causes which warrant the construction of works of such expense and magnitude. Accordingly, we find that these works have been commenced along the Atlantic coast, which is the most densely populated, the most commercial in its character, and the most distinguished for its accumulated wealth. There must necessarily be an intimate connexion in trade and commerce between the principal cities of our Atlantic ports; and the intermediate territory not only contains a comparatively dense and travelling population, but is studded with frequent villages, and even by incorporated cities, linked in various forms, all going to swell the amount of trade and transportation. These facts have all combined to induce the establishment of the most important lines of railroads upon the Atlantic frontier. Although this portion of our territory abounds in water-communication, still the tracks of the railroads, running in direct lines from place to place, furnish means of transportation during the whole of the year.

"The commencement of the grand Atlantic line of railroads already constructed, except for a few miles at its northern point, we find at Portsmouth, in the state of New Hampshire. From this point, extending a distance of about forty miles, a railroad has been completed to the city of Boston. Here a northward diverging track reaches to Lowell, where cars and railroad engines are manufactured to a considerable amount; the length of which line is about twenty-six miles; and from this great manufacturing city another track is laid out to Concord in the same state, thus furnishing a valuable channel of transportation from the place which has been justly entitled the 'American Manchester,' to the commercial metropolis of New England. Boston seems to be the grand terminus of the railroads in New England, and the nucleus from which diverge the two great western and southern routes.

"The first section of what we shall denominate the *Atlantic railroad line*, extends from Boston to Norwich, in the state of Connecticut, and also from the former city to Stonington, in the same state. The line of the Boston and Worcester railroad runs through a beautiful, though broken country, highly cultivated, although not remarkable for its fertility, for the distance of forty-four miles, to the flourishing inland town of Worcester. Here it meets the Norwich railroad, that extends a distance of fifty-eight miles through a picturesque and broken territory, enlivened by pleasant farm-houses, a very large number of manufacturing villages, which are upon its immediate borders, and by numerous waterfalls, which, from the speed of the cars, seem to glance in the sun in continuous succession, like some scene of enchantment. At Norwich, the line unites with steamboat navigation, and furnishes a rapid conveyance to the city of New York. The other line to which we have alluded, as running from Boston to Stonington, combines like advantages, both on account of the directness of the route to the steamboat navigation of Long Island sound, and from the fact, that it passes through some of the most flourishing towns of Massachusetts, including Dedham and Roxbury, to the manufacturing capital of Rhode Island, the city of Providence. Its length to that city is forty-seven miles, and it furnishes a certain and safe mode of travel and transportation from Boston to New York, through Long Island sound, which, of course, is always open to navigation, even during the winter. From Stonington a most convenient line of travel will be furnished by the Long Island railroad, twenty-seven miles of which are now completed. This track is laid out along the

whole extent of that island, and commencing at the South Ferry, in Brooklyn, will terminate at Greenport, upon the shore of the sound.

"Passing from the city of New York a short distance, we soon arrive at the track of the railroad which leads directly to Philadelphia, and from this a line extends to Baltimore, and from Baltimore one to the city of Washington. Crossing the Potomac, we have yet another track marked out in Virginia, from Alexandria to Fredericksburg, from Fredericksburg to Richmond, from Richmond through the low and level pine lands of North Carolina to Wilmington, in the same state, with a diverging track to Norfolk, at the mouth of the James river; and also two lines marked out across the whole length of the state of Delaware. From Wilmington, a railroad is laid out along the shores of South Carolina to Charleston, in the state last named. Thus we have a continuous line of railroad projected, and in the greater part executed, along the Atlantic seaboard, including the most populous and powerful states, which, when completed, will afford the most splendid route of travel to be found in the world, extending from the metropolis of the north to that of the south, furnishing ample means and motives for communication between the widely extended sections of the country, a cheap channel of transportation for the productions of its several parts, and thus binding together in fraternal bonds of trade, commerce, and social interest, the northern and southern portions of the territory.

"Boston, New York, Philadelphia, and Baltimore, are in fact made the factors of the great west; and, were the western market cut off from the eastern cities, there would be a sensible diminution of the mercantile prosperity of our most important commercial emporiums. Accordingly, it has long been a matter of rivalry with those cities to secure the largest portion of the western trade, by furnishing the most prominent inducements to western merchants to visit them for the purpose of making purchases of their goods. To further this object new and convenient steamboat routes have been opened, and canals and railroads have been projected and carried out.

"Massachusetts, which appears to have been considered heretofore in an insulated position, exporting, in the words of a distinguished statesman, nothing but 'granite and ice,' seems recently to have started upon a new and brilliant career of internal improvement by railroads, which is properly backed by its vast accumulated capital. The fact is doubtless within the remembrance of our readers, that but a few years since, it was a matter of reasonable doubt whether the city of Boston, its commercial metropolis, was not, in fact, retrograding in population; and it is only until recently that the keen forecast and energetic enterprise of its citizens have burst forth in the establishment of works which, considering the time in which they have been commenced, appear almost unexampled, and that are destined to add greatly to its wealth. Besides the introduction of a line of steamships from England to that port, there has recently been nearly carried out a line of railroads that will connect that city with the shores of Lake Erie.

"With a view to unite the trade of the west with Boston, a railroad line has been completed in its several sections, between that city and Albany, which is connected with sections running directly to Buffalo, upon the shore of Lake Erie. This railroad continues the line from Boston to Worcester, running through the country to West Stockbridge, and here it intersects the Hudson and West Stockbridge railroad, passing by the towns of Charlton, South Brookfield, West Brookfield, Palmer, and Wilbraham. The length of the section of this railroad east of the Connecticut is fifty-four miles, and of that on the west of the river is sixty-two miles, the whole length from Worcester to the state line being 106 miles. The line which this last-named railroad meets, commencing at West Stockbridge, in Berkshire county, Massachusetts, possessing, as it does, a branch to Pittsfield, and passing through Lebanon Springs, and through Rensselaer and Columbia counties, proceeds in a south-easterly direction, to Greenbush, opposite to Albany, the length of the line from Albany to West Stockbridge being forty-one miles. This railroad will come into keen competition for the western trade with the navigation of the Hudson, which, it is well known, is now one of the most important channels of travel in the nation.

"Having arrived at Albany, we reach a series of railroads that is continued from that city to Buffalo, which terminates the great chain of communication from Boston to the lakes. The first link in this chain is the Mohawk and Hudson railroad, extending for a distance of fifteen miles from Albany to Schenectady, that work having been commenced

in 1830, and a double track finished in 1833. From Schenectady, a diverging track branches off to Saratoga, a distance of twenty-one miles, giving to the crowds of beauty and fashion, who resort in summer to the medicinal springs that distinguish this favourite point, an elegant and convenient channel of travel to the fairy scene. The Rensselaer and Saratoga railroad also reaches the same point, commencing at Troy, and with the Schenectady line terminating at Saratoga. From Schenectady, a railroad has been finished to Utica, a distance of seventy-seven miles, running through a fertile portion of the valley of the Mohawk, and passing several thriving villages, such as Caughnawaga, St. Johnsville, Manheim, Little Falls village, and Herkimer. Here it reaches a viaduct, by which it crosses the Mohawk, and thence proceeds through a fertile and picturesque territory to Utica. The Syracuse and Utica railroad is an extension of this line for the distance of fifty-three miles, and is deemed the most productive work in the state of New York. It passes up the southern acclivity of the Mohawk, nearly parallel with the Erie canal, which it crosses when entering Rome. Leaving Rome, it recrosses the Erie canal, and passing through the villages of Canistota, Sullivan, Chittenango, Fayetteville, and Orville, terminates at Syracuse. This railroad route is continued to Buffalo by the Syracuse and Auburn railroad, which runs a distance of twenty-six miles, through a beautiful, rolling, and densely-settled country, and then unites with the Auburn and Rochester railroad. This work, which is eighty miles in length, is now under contract, and a considerable portion has been already graded. About three-quarters of the line between Rochester and Canandaigua, a distance of twenty-nine miles, have been completed, and workmen are engaged upon the heaviest sections of the track. The great western track from this point is continued by the Tonawanda railroad, extending from Rochester upon the Genesee river to Attica, traversing the townships of Gates, Chili, and Riga, in Monroe county, and those of Bergen, Byron, Stafford, Batavia, and Alexander, in Genesee county, for the distance of forty-five miles. From this point the Attica and Buffalo railroad terminates the grand chain of intercommunication from Boston to the lakes. This last-named work is thirty miles in length, and is now in progress. Numerous causes may, of course, operate which will retard the progress of the great northern line of railroads to the west, but it is believed, that as early as July, 1841, it will be completed throughout its whole extent; so that a magnificent avenue of communication will then be furnished, both for travellers for pleasure, who can now visit the Niagara Falls by a railroad already constructed from Buffalo, and for the transportation of agricultural products and manufactured goods throughout its whole line, from the Atlantic to the lakes!

"In this brief view of the great northern railroad line to the west, we have not referred to the minor railroads along its track, and designed to connect the principal towns of the states through which they pass. In the state of Connecticut, besides the great line, forming links in the national chain, cars are now regularly plying between Hartford and New Haven, on a railroad constructed between the two places, for the distance of about forty miles; and a charter was also granted by the legislature of Connecticut, in 1836, authorising a company to construct a railroad from the north line of the state, near the town of Sheffield, through the valley of the Housatonic by New Milford to the town of Brookfield, and from that point to the city of Bridgeport, in the county of Fairfield. Nor have we alluded to the diverging track from the great northern line to the shore of Lake Ontario, which has been projected, or to that from Saratoga to the banks of Lake George.

"We now pass the second grand track, which has been projected to unite the western trade with the eastern market. New York, so admirably situated for foreign and inland trade, a state which has always been foremost in the ranks of internal improvement, it is well known has long held an almost undivided sceptre over the western trade. With its magnificent Hudson, and its Erie canal, furnishing a free navigation from the ocean to the lakes, this state has called into keen competition the enterprise of her now rival cities, and it befits her to bestir herself, unless she desires to see that sceptre shaking in her grasp; for while other states, perceiving the advantages which have been produced to this state by convenient channels of communication to the west, have nearly completed important public works extending into that quarter, New York has been too often satisfied with their mere projection. The first step which New York has taken, in the line of railroads calculated to secure to herself the western trade, is the Harlem railroad, commencing near the city

hall in New York, and running a distance of eight miles to Harlem strait. From this point, a bridge crosses the strait to Morrisania, at which place the New York and Albany railroad commences. This road, starting at that point, proceeds through the county of Westchester, midway between the Hudson and Long Island sound; and from the northern boundary of that county, it passes through a portion of the rich counties of Putnam and Dutchess, by the centre of the county of Columbia; and from that point to Greenbush, opposite to Albany, and thence to Troy. The whole distance of this line of railroad, from the city hall in New York to Albany, is 147 miles. It passes through a country rich in agricultural and mineral resources.

"We have not here alluded to the several minor intersecting lines established by the enterprise of the state of New York, which are designed to connect important points, and all made tributary to the principal tracks. We may mention, however, the Hudson and Berkshire railroad, which commences at the city of Hudson, and terminates at West Stockbridge, in Massachusetts, a distance of thirty-three miles, where it intersects the great western railroad, extending to Worcester. To this may be added the Catskill and Canajoharie railroad, extending from Catskill to Canajoharie, a distance of seventy-eight miles. The Albany and West Stockbridge railroad, commencing at Greenbush, and to which we have already referred, is a work of considerable importance. Nor are the minor works, such as the Rensselaer and Saratoga railroad, the Troy and West Stockbridge, the West Troy and Schenectady, the White Hall and Saratoga, the Buffalo and Niagara Falls railroad, the Lockport and Niagara railroad, the Buffalo and Black Rock, the Rochester railroad, the Ithaca and Oswego railroad, the Bath, the Ogdensburg and Champlain railroad, the Oswego and Utica, and the Port Kent and Keesville railroad, some of which have been completed, and others in the process of construction, of less consequence to this great state, uniting, as they do, important points, and intersecting the principal lines east and west.

"We now proceed to the consideration of the other great railroad line, which has been projected to connect the trade and commerce of the west with the city of New York, and denominated the New York and Erie railroad, because it is destined to unite Lake Erie with New York by a continuous track from the shore of that lake to a point within twenty-five miles of the latter city. This projected line commences in Tappan, Rockland county, upon the Hudson, and pursuing a north-westerly course through Orange county, passes over the Walkill by Mount Hope, crosses the Hudson and Delaware canal, and traverses for a few miles the valley of the Nevisink. Starting from this point near Monticello, in Sullivan county, it proceeds in a north-westerly direction to Oswego, and following a western course through the southern tier of the counties of the state of New York, Steuben, and Cattaraugus, it is designed to terminate at Westfield, in Chautauque county, upon the shore of Lake Erie. The whole distance of this gigantic work is not less than 450 miles, and when we view the motives for its ultimate completion furnished by the growing population of the country, and the fact that it passes through a territory rich in resources, we do not despair of its ultimate success, although by the charter granted by the legislature of New York, furnishing the credit of the state for its construction, to the amount of 3,000,000 dollars, the whole track is not required to be completed until a period of twenty years.

"Pennsylvania has also projected works which traverse the surface of the state like an iron network. Besides numerous intersecting lines meeting the railroads of other states, she has planned and partially carried out a grand western line, extending from Philadelphia to Pittsburg, her remotest western boundary, at the junction of the Allegheny and the Monongahela, constituting the head waters of the Ohio, and designed to connect the commerce of the west with its commercial capital, and running from that city not only to Pittsburg, but also to Erie, upon the shore of the lake which bears its name. The first section of this chain is comprised in the Columbia and Philadelphia railroad, which commences at the intersection of Vine and Broad streets, in the last named city, meets those of the Schuylkill, Brandywine, and Conestoga, and passes through the counties of Philadelphia, Chester, and Delaware, and the towns of Downingtown and Lancaster, the Westchester branch leaving the main track about twenty-two miles from Philadelphia, and the track to Harrisburg at the city of Lancaster. At Harrisburg, a continuation of this route is furnished in the Cumberland valley railroad, a length of fifty miles, and terminates

in Chambersburg. Here a track of the length of thirty miles pursues a southern course, and ends at Williamsport, on the Potomac, in the state of Maryland, where it intersects the Ohio and Chesapeake canal. At Chambersburgh, a railroad is projected to Pittsburg, through deep valleys and around high mountains, requiring the main ridge of the Alleghany to be tunneled. Running over Laurel hill, and along the valley of the Loyalhanna, and passing through a gap in Chesnut ridge, it courses a part of the valley of the Monongahela to the city of Pittsburg. This stupendous work, when finished, will be a monument of national enterprise scarcely equalled in any age, and will open the vast wealth of the largest manufacturing town of the west, and the commerce of the head waters of the Ohio, to the markets of the elegant city of Penn.

"Besides this track to the Ohio, it has been found of great public importance to the state of Pennsylvania, to extend its intercommunication with the borders of Lake Erie, as her north-western boundary reaches to the shore of that lake. The first link in this chain is the Philadelphia and Reading railroad, which has its point of commencement at the foot of the inclined plane upon the Columbia and Philadelphia railroad, and ascending the right shore of the River Schuylkill, traverses the counties of Montgomery, Chester, and Berks, and enters the town of Reading, in the county last named. From Reading, a railroad runs through the counties of Berks, Schuylkill, and Northumberland, and passing through Pottsville, terminates at Sunbury. This railroad is in the greater part constructed, and from its terminus, commences the Sunbury and Erie railroad, which terminates the grand chain of the north-western route. Owing to the recent commercial depression which has prevailed, little has been done towards the completion of this great work excepting its location and survey, extending, as it will, from the city of Philadelphia to the town of Erie, a distance of 420 miles. It is well known that the state of Pennsylvania has numerous tracks of greater or less extent, running from Philadelphia, as well as from the interior, to most of the prominent points of trade and production, which either afford prominent local advantages to the population upon their routes, or are made tributaries to the grand chains which girdle the most productive portions of our territory.

"Passing to the south we arrive at Baltimore, in which city commences the third grand railroad route from the east to the west, the Baltimore and Ohio railroad. This road, it is well known, is in part constructed, and passing through the greater portion of the state of Maryland, and running near the track of the Chesapeake and Ohio canal, is designed to terminate at Wheeling, upon the Ohio river, thus giving to the city of Baltimore, through a track of 280 miles, its share of the trade and commerce of the Ohio. Nor has the south been wanting in efforts to effect the same objects with the other states. At Richmond, we find a track branching off westward from the Atlantic line, and intersecting the great railroad projected between Charleston and Cincinnati, and another line at Hicksford, in the same state, directed to the same track. At Charleston an extensive line has been laid out through the bordering states, northward by Kentucky to the heart of the west, the city of Cincinnati. Savannah is connected with this railroad by a branching track, and even upon our uttermost southern border, both at Pensacola and New Orleans, we find lines of railroads running northward, with various branching routes, which are designed, not only to connect their rich territory with Vicksburg, Memphis, and other points upon the Mississippi river, but also with the internal resources of the remotest north-western states. Even upon the western side of that river, we find tracks marked out to remote points of the Missouri beyond St. Louis.

"The progress of railroads in the young states of the west has been slow, from the newness of the country, covered as it is in the greater part by dense forests or prairies, sleeping in their primeval luxuriance and solitude, and from the general want of idle capital; but we find the enterprise of the people in this region equally prompt with that of the eastern states, in the projection, if not in the construction, of these public works. Commencing in the region of the upper lakes, we discern a railroad laid out from Cassville on the Upper Mississippi to Milwaukee, upon the western coast of Lake Michigan, and intersecting another road from the navigable waters of the Illinois river, designed to connect Lake Michigan with the Mississippi; and from this point a southern line (intersected by two tracks running westward), sweeping round to Louisville, in Kentucky, and intersecting the great track of the Charleston and Cincinnati railroad. From Cincinnati as the centre,

we perceive tracks radiating into the neighbouring states, to Indianapolis in Indiana, and Lafayette, upon the Wabash; to Perrysburg upon the Maumee; and to Cleveland, upon Lake Erie: the last taking in its course Columbus, the capital of the state. From the neighbouring state of Indiana, at Indianapolis, its capital, another series of railroads diverges, to Lafayette, upon the Wabash, and to the shores of the Ohio; or if we survey the peninsula of Michigan, we find no less than three tracks projected across that territory, designed to connect the shores of Lake Michigan with the rivers St. Clair and Detroit, Maumee and Sandusky, upon one of which, namely, the 'Detroit and St. Joseph,' the steam cars are now in operation for forty miles to Ann Arbor. Besides this, a railroad of a few miles is now in operation from La Plaisance bay to the city of Monroe, in Monroe county, of the same state.

"In drawing this brief sketch of the railroads in the United States, we have only given the outlines of this system, as it prevails in our own country, merely chalking out the more extended and general routes designed to connect its remote parts. We are well aware that there are numerous local works to which we have not even alluded, in successful operation in the several states; and other works, laid out but not completed, which are in number almost equal to the several settlements within our borders. They all, however, belong to one great plan, and clearly evince the character of our people, projecting, as they have done, in so short a time since railroads were introduced at all, so magnificent a system of public works, and completing so many and so important channels of intercommunication between the several parts of our territory. Whether, in fact, too many and too expensive works of this character have not been projected, considering the amount of our population and our wealth, is now a matter of question. Indeed, we have no doubt that some of these tracks may have been projected for mere purposes of speculation, and will be discarded for want of means, or as other and more valuable routes shall be developed; but we have as little doubt that the grand tracks which have been marked out to connect the remote points of the country, will ultimately be carried through as the increase of population and production shall furnish the motives for their establishment, and the augmentation of our wealth provides the means for their construction. The more important lines will, doubtless, be first finished where there are the most dense settlements, the largest amount of transportation, and the most capital to carry them through. Accordingly, we find that those have been advanced to the most successful issue which have been constructed along the Atlantic seaboard, and connecting our most important cities; while in the newer and more thinly populated states of the west, where even passable common roads have been scarcely established through the deep and damp vegetable mould of the forests, the lines of their railroads have been in most cases merely laid out, and companies for their completion chartered, not a single spade having been sunk upon their tracks."

CANALS AND RAILROADS OF THE NEW ENGLAND STATES.

In the separate description of these states, we have given an account of the public works and internal improvements of each (which see).

In MAINE, the Cumberland and Oxford canal, fifty miles long, was completed in 1829, at an expense of about 250,000 dollars. The Bangor and Orono canal, twelve miles long, completed in 1836.

The *Portland, Saco, and Portsmouth* railroad, communicates with the railroad to *Boston*. The railroad projected from Bangor to Portland would, if executed, complete the sea-coast line of railroads. This line of intercourse, north from Portland along the coast of Maine, is at present carried on by steamboats.

In NEW HAMPSHIRE, the canals are chiefly *cuts* with locks, for the improvement of the navigation of the Merimac river. The Massachusetts railroads

pass over New Hampshire to Portsmouth, fifteen miles and three-quarters, and from Lowell to Nashua, and the Boston and Maine fourteen miles to Exeter.

MASSACHUSETTS.—For a detailed account of the railroads of this state, altogether 415 miles of which were completely in operation in 1843, see the separate account of Massachusetts. The whole length of the railroads of this state and of those communicating with them in other states, extending as far as Lake Erie, comprise 1203½ miles; see tabular statement, under the head of Public Works of Massachusetts. The Middlesex canal, from New Lowel on the Merimac to Boston, about thirty miles long, was the first canal executed in the United States. It was completed as early as 1804. It opens a further navigation by the Merimac and several canals (in all about fifteen miles) along that river to Concord, in New Hampshire.

In **RHODE ISLAND** the Blackstone canal extends through part of this state from Providence to Worcester in Massachusetts. The Providence and Boston railway, and the Providence and Stonington railway, forty-seven miles long, passes chiefly through this state.

In **CONNECTICUT**, the Farmington canal, from New Haven to the north boundary of the state, fifty-six miles; thence to Northampton, Massachusetts. At Enfield, a canal of five miles passes round the falls of the Connecticut river. The Norwich and Worcester railway extends fifty-eight miles and a half north through the state. The New Hartford and New Haven railway, thirty-six miles. The Housatonic railway, from Bridgeport to North Canaan, seventy-three miles; thence to West Stockbridge, Massachusetts.

Western (Massachusetts) railroad.—The tenth report of the directors of the Western Railroad corporation has been laid before the stockholders, and printed. It presents a very full and satisfactory account of the condition of the road and its finances, at the close of the year 1844. The capital authorised by the original charter, was 2,000,000 dollars; and it was increased 1,000,000 dollars by a subsequent act of the legislature of Massachusetts, the state subscribing for that amount—making the chartered capital 3,000,000 dollars; one-third owned by the state, and two-thirds by 1121 private stockholders.

* First year of opening through to Albany.

† As corrected in report of January, 1843, to include damages for collision of 1841.

From 1842 to 1843, the increase of receipts from passengers was $3\frac{1}{2}$ per cent; increase from merchandise, $21\frac{1}{2}$ per cent. From 1843 to 1844, the increase of receipts from passengers was $30\frac{3}{4}$ per cent; increase from merchandise, $34\frac{1}{2}$ per cent.

By reference to the tables of each year, it will be seen that the number of through-passengers is stated in 1844 less than in 1843. This is mainly owing to the fact that, in the greater part of 1843, the difference between the *through* and *way fare* was so great, that way-passengers, to a considerable extent, took through-tickets, and were thus registered as through-passengers. There was no inducement for such a practice in 1844. The whole number of tons, nett, carried one mile by the merchandise trains, was—

In 1844	11,166,704
1843	9,414,621
Increase	1,752,083

The whole tonnage is equal to 71,581 tons carried over the whole length of the road, 156 miles. The number of miles run by merchandise trains in 1844 being 255,376, is equal to 1637 trips through, averaging $43\frac{3}{4}$ tons each train. The through freight from Boston to Albany, in 1843, was 5268 tons; in 1844, 6764—increase, 1496. The amount of freight received at, and sent from, Boston, in connexion with the Western road, was—in 1844, 69,842 tons; in 1843, 56,376 tons; increase, 13,474 tons.

The number of barrels of flour, from Greenbush and vicinity, to Boston, was—

In 1844	154,413
1843	123,366—31,074

The whole number of barrels of flour sent from Greenbush to all stations, was, in 1844, 297,403. The amount charged on all merchandise forwarded eastward, from the Greenbush station, was—in 1844, 223,572 dollars; in 1843, 167,087 dollars; increase, 56,485 dollars.

The amount charged on merchandise forwarded from Greenbush eastward, in the month of January for three years, was—in 1843, 6622 dollars; 1844, 13,677 dollars; 1845, 20,216 dollars.

BOSTON AND WORCESTER RAILROAD.

STATEMENT of Income and Expenses, for the Year ending November 30th, 1844.

FREIGHT.	Boston and Worcester Road alone.	To and from Western Railroad.	To and from Northern and Western Railroad.	TOTAL.

Total expenses	90,872	108,871	34,259	234,002
Total nett income	134,850	34,181	30,421	208,191

The earnings on freight are given above, and not the receipts on freight.

Maine and Housatonic Railroad.—The length of this road, as we learn from the report of the directors, of the 20th of June, 1844, from the tide-water at Bridgeport, to the north line of the state of Connecticut, is 73 90-100 miles. In this distance there are twelve regular stations for the receipt and discharge of passengers and freight, namely: at Stepney, Botsford's, Newtown, Hawleyville, Brookfield, New Milford, Gaylord's Bridge, Kent, Cornwall Bridge, West Cornwall, Falls Village, and North Canaan. The maximum grade is forty feet to the mile, but more than half the length of the road is passed on grades of under twenty-six feet to the mile. The total expenditure, for the construction of the road and appendages, is 1,244,122 dollars 91 cents. This expenditure, for a road of seventy-four miles in length, with an ample outfit of engines and cars, will bear a favourable comparison with any other railroad in the United States, of similar construction.

The capital stock, by the resolutions of the company, and in pursuance of the charter, has been extended to 1500 shares of 100 dollars each.

The whole subscription amounts to	shares. 8696
No payments have been made on	shares 195
And but partial payments on	„ 334

Making liable to forfeiture 529

And paid in full, and issued 8167

Should the shares liable to forfeiture be sold, and purchased by the company, it will hold for future subscription.

The stock now liable to forfeiture	shares. 529
And the unsubscribed shares	6304

Making a total of 6833

The cash and bills receivable actually received for stock, are as follows:—

On 8167 shares, paid in full	dollars. cts. 816,700 00
On 334 „ in part	7,112 20

Total from capital stock 823,812 20

The board of directors request particular attention to the cost of the road, as stated, being

	dollars.	cts.
Cost	1,244,122	91
And the amount received from capital stock	823,812	20

As the difference between these two amounts 420,310 71 forms the original debt of the company, and created its numerous embarrassments. This deficiency of capital, and consequent indebtedness, have compelled the company to prosecute its business on the most unfavourable terms; until, at length, it became more than probable that the whole property would be sacrificed to discharge the certified debt, scarcely exceeding in amount one-fifth of the cost of the road and appendages. Hence, also, arose the impression that the business of the company did not meet its expenses; and, because the profits of current business were not adequate, in two years, to reimburse one-fifth of what ought to have been capital, in addition to interest and expenses, that the whole enterprise was visionary, and the shares of no value. This disaster was, however, averted by the energy and confidence of those who, having embarked in the company with full knowledge of its resources and prospects, retained their belief in the intrinsic value of the road. The whole indebtedness of the company, with interest, to the 1st of June, 1844, amounts to 398,726 dollars 36 cents, qualified as follows:—

	dollars.	cts.
1st class—Certified notes, interest at seven per cent.	277,138	97
2nd „ Land claim notes, interest at six per cent.	20,797	34
3rd „ Claims secured by second mortgage, ditto	69,427	89
4th „ Demands with no special security	31,362	16
Total	398,726	26

It will be observed, that a debt of 420,310 dollars 71 cents, bearing interest in part from 1841, and all from 1842, is thus liquidated on the 1st of June, 1844, at 398,726 dollars 26 cents. The receipts from the business of the road have, then, not only paid all current expenses of its management and repairs, and also the completion of many appendages, essential for the extended demands of trade, but have also actually discharged the interest, and reduced the principal.

The following is a statement of the receipts of the road, for a period of five months, in each of the years 1842, 1843, and 1844:—1842, 32,310 dollars 27 cents; 1843, 55,652 dollars 4 cents; 1844, 68,148 dollars 30 cents.

Statistics of the Eastern railroad.—The annual report of the Eastern railroad has been distributed to the stockholders, and will be laid before the legislature of Massachusetts at its next session. From this report, we gather the following facts:—The whole cost of the road, in Massachusetts, has been 2,361,098 dollars. There has been received, from 18,000 shares, 1,800,000 dollars. State scrip, 500,000 dollars; and sundry accounts, 61,098 dollars. The Eastern, in New Hampshire, has cost 482,500 dollars. The trains of the two companies have made 8583 trips, amounting to 196,097 miles, and conveying 443,403 passengers; and on the Marblehead Branch, 34,531; making a total of 447,934 passengers transported during the past year. The receipts have been, from Marblehead Branch, 3460 dollars, and 293,401 dollars from main line of road. Of the whole receipts, 257,674 dollars were from passengers, 28,393 dollars from freight, 10,068 dollars from mails, and 124 dollars from incidental sources. The expenses have been 103,452 dollars; leaving the net earnings of both roads 193,308 dollars. To this amount, rents of real estate, and Portsmouth Bridge dividends, add 5,969 dollars; making a total of income, 199,278 dollars. The payments have been 25,000 dollars for interest on state scrip, 78,855 dollars for dividends on stock in January, and 79,887 dollars for dividends payable on and after July 3rd. The sum of payments, 183,742 dollars, when deducted, leaves a balance of 15,535 dollars to profit and loss; which, with profits on sale of state scrip, 806 dollars; Boston depôt estate, 858 dollars; Cunard wharf, 2500 dollars; East Boston lands, 5864 dollars; and sundry estates, 313 dollars, makes an addition to surplus fund, after paying interest balances of 3132 dollars, to amount of 22,744 dollars. The

old surplus on reserved fund was 19,920 dollars; and that account is now increased to 42,664 dollars. The report concludes by stating, as the result of the year's operations, a dividend of seven per cent, and an addition of 22,744 dollars to the surplus fund. The expenses of the company were 7202 dollars less than last year, and 46,012 dollars less than the year before last.

The Portland, Saco (Mobile), and Portsmouth (New Hampshire) railroad company was incorporated March 14, 1837; organised December 25, 1840; renewed November 25, 1845. It is fifty-one miles long, connects with the Eastern by a bridge over the Piscataqua river, at Portsmouth, and with Boston and Maine at South Berwick, thirteen miles east of Portsmouth. For the year ending November 30, 1843, it divided three and a half per cent; and, for the past year, six per cent. Its cost is not definitely settled, but will amount to about 1,200,000 dollars, a little over 23,000 dollars per mile. It is laid with a T rail, fifty-six lbs. to the yard; highest grades, thirty-five feet per mile. Passes through the towns of Keeting, Elliot, South Berwick, North Berwick, Wells, Kennebunk, Saco, Scarborough, to Portland.

Years.	Gross income. dollars. cts.	Net income. dollars. cts.
1843	89,997 08	47,165 98
1844	124,497 39	74,841 25

The number of miles run being severally 102,036 and 117,008, and the expenditure forty-seven cents, and forty-two and a half cents per mile run.

The Eastern railroad, extending from Boston to Portsmouth, New Hampshire, fifty-four miles, was partially opened August 28, 1838, and, for the whole distance, November 9, 1840, and has also a branch of three miles, to Marblehead.

Number of miles run, 204,962; number of passengers, 544,994; average cost of carrying a passenger one mile, 1.166 cents; receipt from each company per mile, 3.351 cents.

Boston and Lowell railroad.—The distance from Boston to Lowell, by this road, is twenty-six miles. The total amount of capital paid in is 1,800,000 dollars. The amount of profits divided during the year 1844 was 144,000 dollars, in two dividends, of four per cent each, on a capital of 1,800,000 dollars. The amount of freight during the year has been much greater than in any preceding period, amounting to 151,731 tons. The freight and passenger tariff has been reduced since the last annual report. It was formerly one

dollar for passengers, in first-class cars ; it is now, in first-class cars, for passengers, from Boston to Lowell, seventy-five cents ; and fifty cents in second-class cars. Merchandise, generally, at one dollar fifty cents per ton ; if in cargoes, landed on the railroad wharfs at one dollar twenty-five cents per ton, without any charge for wharfage. Forty-five thousand four hundred and twenty tons were carried over this road for the factories, during the past year ; and the company have a special bargain with the Lowell factories. They are charged one dollar twenty-five cents for all cotton, wool, and goods made of those articles, and one dollar per ton for all other articles. The stockholders of the Western Branch railroad, incorporated in 1843, have transferred their rights and privileges to the Boston and Lowell company. This road begins seven miles from the depôt of the Lowell and Boston, out of the latter city. The road has a single track, with a heavy Trail, of fifty-six lbs. to the yard, upon chesnut sleepers, seven feet long, and six inches in depth, two feet seven inches apart, resting upon a bed of clear gravel, two feet deep. The rails are in lengths of eighteen feet, and the joints are secured by a clasp chain of twenty lbs. weight.

The whole cost of the Boston and Lowell railroad, with its depôts, cars, engines, and appurtenances, and about fifty-eight miles of single track, amounts to 1,902,555 dollars 67 cents ; of which—

	dollars.	cts.
Land for tracks and land damages	73,909	48
Depôt lands and buildings	276,079	48
Engines and cars ~~23~~	127,238	43
Iron rails, bolts, and chairs	282,833	95
Bridges (sixty-six in number) and culverts	196,831	58
Road, excavation and embankment, trench walls, stone blocks and sleepers, laying rails, branch tracks at Lowell, superintendence, engineering, &c.	910,222	06
Woburn Branch railroad	35,440	68
Total	1,902,555	67

By the directors' report for 1844, it appears that the surplus on hand on the 30th of November, 1844, after paying the dividends of that year, amounts to 18,433 dollars 36 cents, which is the whole surplus remaining undivided, after nine or ten years' operations. The amount on hand in the year 1841, when it was largest, more than half of which was derived from withholding the winter dividend of 1836 (in which year only two per cent was divided), has been absorbed by the necessary expense of taking up and relaying the first track, on which too light a rail had originally been laid, as has been more fully stated in former reports. The cost of this work was 121,558 dollars 84 cents, and is spread over the three years 1841, 1842, 1843.

STATEMENT of Capital paid in at date, charged and credited to construction, and whole Cost of Construction at the end of each Year, from 1835 to 1844, inclusive.

November 30 of the years.	Capital paid in at that date.	Charged to construction in that Year.	Credited to construction in that Year.	Whole cost of construction at the end of the year.

* Advance on 600 shares new stock sold at auction, for account of the corporation.

† Balance of interest account charged to expenses.

The cost of a share on the 30th of November, 1835, when the first annual settlement of accounts was made, after the opening of the road, including interest, at six per cent on the assessments from the time when they were laid, and deducting the dividend paid for the fraction of that year, amounted to 540 dollars 75 cents, or almost exactly eight per cent on the par value. Since then, in the nine years which have followed, the dividends have averaged 7.1-9 per cent on the par value of the shares.

THE Annexed Table of the Length, Cost, Receipts, Expenditures, &c., &c., of the Railroads in Massachusetts, is compiled for the *Merchants' Magazine*, from Annual Reports to the Legislature of Massachusetts. Deducting the Cost of the Fitchburg Railroad, which was only open to Acton, Twenty-seven Miles, on the 1st of October, 1844, the net Income was 7.11-100ths per cent upon their cost.

* Let to Housatonic railroad.

† Open to Acton, twenty-seven miles, October 1st, 1844.

‡ Average.

CANALS AND RAILROADS OF NEW YORK.

THE ERIE CANAL.—This great work, by far the most important canal in the United States, extends from the tide waters of the Hudson river, at the city of Albany, to Lake Erie, terminating at the city of Buffalo. Its general course from Albany is a little north of west, passing up the valley of the Mohawk river, which it crosses at the lower aqueduct, then follows the left or north bank of the Mohawk for thirteen miles, which it recrosses at the upper aqueduct; thence pursues the south bank of the above river, through the counties of Schenectady, Montgomery, Herkimer, and Oneida, where it leaves the Mohawk valley, and continues west through the counties of Madison, Onondaga, Cayuga, the north-east angle of Seneca, Wayne, touching Ontario on the north at Port Gibson, Monroe, Orleans, Niagara, and Erie, where it terminates. Its whole length, including the basin at Albany, is 364 miles; passing through several flourishing towns and villages, many of which have sprung into existence since its completion. It is intersected by several lateral canals of much importance, all of them communicating with other navigable waters. At the Cohoes, in the town of Watervliet, it forms a junction with the Champlain canal; at Utica, it connects with the Chenango canal; at the village of Rome, with the Black River canal and Feeder; in the town of Vernon, with the Oneida Lake canal; at the village of Syracuse, with the Oswego canal; at the village of Montezuma, with the Cayuga and Seneca canal; and, at the city of Rochester, with the Genesee Valley canal. From Albany west there is a succession of locks, until what is termed the "long level" is reached, in the town of Frankfort, Herkimer county, elevated 425 feet above the Hudson, extending to Syracuse, a distance of sixty-nine miles and a half, without any intervening lock; from thence the line descends, and then re-ascends until it reaches Rochester, elevated 506 feet, where there is another continued level of sixty-four miles. At Lockport, the canal ascends the mountain ridge, by five double combined locks, each 12.4 feet rise. Nine miles west of Lockport, the canal enters the Tonawanda creek, with which, for a distance of about ten miles, it is identified; at a further distance of twelve miles, this magnificent work unites with Lake Erie. Total rise from the Hudson river to Lake Erie, 560 feet; rise and fall, 692 feet. It was commenced in 1817, and finished in 1825, at a total cost of 10,731,595 dollars.

By an act of the legislature in relation to the Erie canal, passed May 11, 1835, directing the canal commissioners to enlarge and improve the Erie canal, the very expensive project of enlarging this previously great work, was adopted; the want of additional facilities for conducting the increased trade flowing through this channel having become apparent. Considerable progress has been made on this stupendous undertaking, which, when finished, will command the admiration of the civilised world. There was put under contract prior to January, 1839, more than 100 miles of the enlarged canal, including the heavy rock cutting at Lock-

port, with all the mechanical structures thereon, comprising more than fifty double and single locks, besides the five double combined locks at Lockport; the aqueduct over the Genesee river at Rochester; the two aqueducts over the Mohawk river; one over the Schoharie creek, and many others over smaller streams, including culverts, bridges, &c. The estimated cost of all the work for the enlargement of the Erie canal, is 23,284,931 dollars, of which there was put under contract up to 1841, 11,021,932 dollars, on which there has been paid 10,011,146 dollars; leaving a further expenditure of 13,273,784 dollars to be provided for. (See Tables hereafter.) The Enlarged Erie canal, is to be seven feet deep, and seventy feet wide on the surface, with a slope of two feet to one foot in the banks, leaving a width at the bottom of forty-two feet; with double locks eighteen feet wide, and 110 feet long. The present width of the old Erie canal is forty feet on the surface, and twenty-eight feet at the bottom, and four feet deep; the locks are fifteen feet wide, and eighty feet long.

The state legislature has authorised the construction of the following canals, at the time opposite to each one respectively, in the following table. The length of each canal, together with the number of locks and the number of feet of rise and fall, are also appended:—

Total			21,693,010	12
Total revenue of Erie and Champlain canals			1,830,298	25

For the above estimates of the cost of the Erie and Champlain canals, see Canal Commissioners' Report for 1843, Canal Documents, vol. ii., p. 115.*

The Oswego canal, from Salina to Lake Ontario, connects the waters of that Lake with the Erie canal, partly by means of slack water navigation, the expense of which was 525,115 dollars.

Cayuga and Seneca canal from Geneva, on the Seneca lake, to Montezuma, on the Erie canal, was constructed at an expense of 214,000 dollars.

Chemung canal, from the head waters of the Seneca lake to Tioga point, the cost of which with its feeder was estimated, in 1833, at 335,849 dollars.

Crooked Lake canal, from a lake of that name to Seneca lake, cost 136,101 dollars. The Erie and Champlain canals have also navigable feeders.

The Champlain canal connects the Erie with Lake Champlain. The communication is through a grazing, rather than a grain country, fast parting with its forests contiguous to the navigable waters; and, as is before seen, sending to market a surplus annually.

* In 1792, nine years after the close of the Revolutionary war, the Western Company completed a water communication from Schenectady to the falls of the Oswego river, and boats of burden were passed to within twelve miles of Oswego. At Oswego falls there was a portage of a mile, and the navigation was resumed by a smaller class of boats at the foot of the falls to Lake Ontario.

The works of the Western Inland Lock Navigation Company, principally consisted of a series of locks and a canal, at the falls of the Mohawk at Little Falls, a canal, with locks, at Fort Stanwix, from the Mohawk river to Wood Creek (a tributary of Oneida lake and the Oswego river), and a series of locks and dams on Wood Creek.

A boat leaving Schenectady followed the course of the Mohawk river to Fort Stanwix, and passing by the canal at that place into Wood creek and Oneida lake, entered the Oswego river eleven miles south of the falls, and twenty-three miles from Oswego. There was but one portage in the whole distance (at Oswego falls) between Schenectady and Lake Ontario. However imperfect the navigation, as compared with that of the Erie canal, which superseded it, its influence upon the prosperity, the early and rapid settlement of western New York, is incalculable.

Extract from the Report of the Canal Company:—

"The Erie canal, as before stated,* originally cost the sum of 7,143,789 dollars 86 cents. When the project of enlarging the Erie canal was first advanced to the public mind, what was understood by the idea of enlarging? When an individual speaks of enlarging his house, he means adding a wing to it, or erecting an additional story, or some similar increase of his accommodations. The idea of incurring an expense greater than the cost of a new house of the same size, would scarcely enter his mind—much less an expense several times greater than the original cost. Had it been at first proposed to build a new canal adjacent to the old one, of the same size, the people would have promptly objected to it, on the ground of the expense, and on the ground that if an additional communication were needed with the far west, a route for it, or for a railroad, would have been sought through some portion of the state, not accommodated with a communication to market. Much more would they have objected, had it been proposed to construct three or more new Erie canals, adjacent and parallel to each other. Experience in the enlargement shows that four or five new Erie canals could have been built, at an expense no greater than the enlargement will require. Thus the Erie canal enlargement, like the construction of the three last-named lateral canals, may be said to have stolen a march upon the public mind, and obtained a high vantage ground by insidious steps. The amount expended thus far on the enlargement, is 13,291,616 dollars (see Comptroller's Report of 1844, p. 6), and no one believes it is more than half accomplished, on the plan undertaken."

CLASSIFICATION of the Canal Debts according to the different Rates of Interest.

	Principal.	Annual Interest.
	dollars. cts.	dollars. cts.
At five per cent.....	14,872,009 95	743,600 50
At six per cent.....	1,892,145 23	112,762 44
At seven per cent.....	3,647,136 00	255,299 52
Total.....	20,411,291 18	1,111,662 46

More than 9,500,000 dollars of this debt is payable within five and a half years, viz.:—

	dollars. cts.
Six per cent of 1837	12,771 27
In January, 1834, temporary loan	18,967 00
On the 1st of July, 1845.....	1,700,897 68
After 1845, say January, 1846.....	2,362,535 66
On the 1st of July, 1846	571,304 00
On the 1st of July, 1848	1,584,736 00
On the 1st of July, 1849	2,149,400 00
On the 1st of July, 1850.....	1,256,600 00
	9,656,611 61
Deduct available means on hand, 30th of September	1,987,538 89
Balance to be provided for in 5½ years.....	7,669,072 72

One half of the mill tax, hereafter to be applied to the payment of the canal debts, will add to the revenues applicable to canal purposes, 275,000 dollars per annum, which for six years, makes a total of 1,650,000 dollars. The surplus revenues of the canals may yield 3,000,000 dollars for the same period, making a total of 4,650,000 dollars; deducted from 7,669,072 dollars, it leaves a balance of debt unprovided for at the close of the fiscal year, in 1850, of 3,019,072 dollars. If the canal fund realises the amount due from insolvent banks, 575,184 dollars, there would still remain 2,443,887 dollars unprovided for. In the three years succeeding 1850, the amount of canal debt falling due is only 70,000 dollars.

The secretary of state, pursuant to the resolution of the Assembly, of February 2, 1843, has submitted the second annual report of the several roads in the state to the legislature. The document has not yet been printed, but a gentleman at Albany has furnished us with the tabular statement which follows, carefully copied and compiled from the official manuscript documents. Much care has been taken to compare and verify the various columns, and it may be regarded as strictly correct.

It should be observed, that the column showing the net income of the road, does not, in all cases, express the legitimate earnings of the road. The receipts for the year past include sales of surplus materials, and other extraneous items.

The first seven roads in the table form the continuous line, in the order in which they are placed, from the Hudson to Lake Erie. The average cost per mile, of the whole number of roads, is 30,700 dollars. By reference to the cost of construction given in the table, and deducting the cost of the Schenectady and Troy, and the Albany and West Stockbridge roads, from which no revenue is derived, the total cost of the other roads is shown to be 17,197,251 dollars, from which are derived the aggregate income of 1,100,016 dollars. From this statement results 17,197,251 dollars: 1,100,016 dollars:: 1: 64 or 64-10 per cent on the capital invested.

This is an increase of nearly one per cent over the results for the year 1843. The railroads of Massachusetts ranged about the same for that year. The rate per cent of income, on some 2000 miles of railroads in the United States, as ascertained by Chevalier de Gerstner, in 1839, was very nearly the same. The whole number of miles run on all the roads, is 1,257,529; the cost for running

and repairs is 799,752 dollars; which gives the average cost per mile, sixty-four cents.

The West Stockbridge road is run in connexion with the western railroad, forming a continuous line between Greenbush and Worcester. No separate account has been kept of through and way passengers.

The Mohawk and Hudson Railroad company have an undivided interest with the Utica and Schenectady, Syracuse and Utica, Auburn and Syracuse, and Auburn and Rochester Railroad companies, in 100 passenger cars, and twenty-eight mail and baggage cars.

Of the seventeen railroad corporations of the state, eleven of them have complied with the requirements of February 2, 1843, leaving the following companies in default, viz.: New York and Erie, Buffalo and Black Rock, Hudson and Berkshire, Lewiston, Long Island, and New York and Harlem.

CANALS AND RAILROADS OF PENNSYLVANIA.

Canals and Railroads constructed by the State.—In 1791, a report was made by a committee of the legislature, recommending the improvement of the Delaware, Lehigh, and Lackawana rivers; a canal from the Schuylkill to the Susquehanna, by way of the Tulpehocken and Swatara; the improvement of the Susquehanna, with its north and west branches, and a connexion by way of the Sinnemahoning between the west branch of Susquehanna and the Alleghany river and Lake Erie. A portage connexion was also proposed from the head waters of the Juniata to those of the Conemaugh, in order to form a communication from the Susquehanna to Pittsburg. As railroads were then unknown, it was proposed to connect the canals by means of good turnpike-roads across the dividing summits.

Nothing was done by the state on the subject of internal improvements until 1824, when an act was passed authorising the governor to appoint three commissioners to explore a route for a canal from Harrisburg to Pittsburg, by the waters of the Juniata and Conemaugh rivers; and also the route for a connexion by way of the west branch of Susquehanna and Sinnemahoning, with the waters of the Alleghany river. An examination of the country between the Schuylkill and Susquehanna, through the great valley of Chester and Lancaster counties, was also directed; together with a route “beginning at a point on the river Schuylkill, in the county of Schuylkill, thence by Mahanoy creek, the river Susquehanna, the Moshannon, Clearfield, and Black Lick creeks, the Conemaugh, Kiskiminetas, and Alleghany river to Pittsburg.”

In 1825, an act was passed authorising the appointment of a board of canal commissioners, and directing the following additional surveys to be made: “one from Philadelphia through Chester and Lancaster counties, and thence by the west branch of the Susquehanna and the waters thereof to the Alleghany and Pittsburg; also from the Alleghany to Lake Erie; one other from Philadelphia by the Juniata to Pittsburg, and from thence to Lake Erie; one from the city of Philadelphia to the northern boundary of the state towards the Seneca or Cayuga lake; one through Cumberland and Franklin counties to the Potomac river; and one by the Conococheague, or Monococy and Conewago to the Susquehanna.” A survey was also directed, by the same act, to be made through the county of Bedford, to connect the route of the proposed Chesapeake and Ohio canal with the Juniata route.

By the act of the 25th of February, 1826, the canal commissioners were directed “to locate and put under contract a canal on the east side of the Susquehanna river, from the mouth of the Swatara to a point opposite the mouth of the Juniata; and one from Pittsburg to the mouth of the Kiskiminetas; thus commencing two sections of the main line of communication from Philadelphia to Pittsburg. They were also authorised, as soon as they might deem it practicable

and expedient, to construct a navigable feeder of a canal from French creek to the summit level at Conneaut lake, and to survey and locate a route for a canal from that to Lake Erie."

"In order to sustain the credit of the commonwealth, an internal improvement fund was established (April 1, 1826) under the control of the secretary of the commonwealth, the auditor-general, and the state-treasurer, as commissioners; which fund was specifically appropriated, pledged, and set apart for the purpose of paying the interest and reimbursing the principal of the state debt which might be created in consequence of the construction of the canals and public improvements: the accounts of the fund to be kept separate from the other public accounts." This fund consists of the tolls which were to be received on all the public works, the auction duties, the net proceeds of all escheats, and the dividends on road, canal, and bridge stocks owned by the state. By subsequent enactments, the tax on collateral inheritances, taxes on certain property, and sundry other appropriations were added to the fund.

By the act of April 9, 1827, "the construction of a canal up the Juniata as far as Lewistown; another up the Kiskiminetas and Conemaugh to Blairsville, and one up the Susquehanna to Northumberland were duly authorised." By the same act, "surveys were directed to be made of the route across the Alleghany mountain from Frankstown on the Juniata to Johnstown on the Conemaugh, with a view of determining whether the portage should be by a smooth and permanent road of easy graduation, or by a railway with locomotive and stationary engines or otherwise." Surveys were also ordered between the west branch and the Alleghany river; up the north branch from Northumberland to the state line, and from Pittsburg to Erie by the route of Beaver and Shenango. A survey for a railroad was also directed to be made "from Philadelphia, through Chester and Lancaster counties to the Susquehanna, and also to ascertain the practicability of connecting the north branch of the Susquehanna and Lehigh rivers, by a canal or railway." A survey was, by the same act, directed to be made for extending the canal down the Susquehanna, from the mouth of Swatara to the Maryland line. Operations for the construction of the *French Creek feeder* (to Conneaut lake) was ordered, and surveys directed from Conneaut to Lake Erie. The commissioners were instructed to make a survey for a canal from Philadelphia up the valley of the Delaware to Carpenter's point; "and if found practicable, to locate and contract for the construction of such portion of it as should not exceed the cost of 100,000 dollars, provided that the average expense thereof should not exceed 12,000 dollars per mile."

By the act of the 24th of March, 1828, "the extension of the canals on the Susquehanna, from the mouth of Swatara to Columbia; from Lewistown to Holidaysburg on the Juniata; from Northumberland along the west branch of the Susquehanna to Bald Eagle; from Northumberland to the New York state line, on

the north branch; from Taylor's ferry to Easton, on the Delaware; and from Blairsville to Johnstown on the Conemaugh, were authorised. The Alleghany Portage railroad; the Philadelphia and Columbia railroad was ordered; and preliminary surveys of other lines of proposed improvements were authorised to be executed.

These works were commenced and carried forward with great speed. The credit of the state was then in a highly honourable condition, no one suspected its integrity; money was abundant, and the legislature found no difficulty in borrowing from the capitalists of all countries: especially from England.

Mr. Frego, in an excellent little work on Pennsylvania, observes,—

“ If the system of public works undertaken had been less extensive in the beginning, and had been confined at first to the main line between Philadelphia and Pittsburg, with the addition of the Delaware division; *and these had been constructed with a strict regard to the public interest alone, and managed afterwards with prudence and economy, the favourable anticipations of the people would doubtless have been realised.* But, in order to obtain votes in the legislature for the commencement of the main lines, it was deemed expedient to push the improvements into every practicable part of the state, *that as many as possible should partake of the expected benefit.* The consequence has been the lavish expenditure of millions on lines as yet unproductive; while a system of management directed by party politics, and the employment of countless swarms of public agents, as a reward for political services, without due regard to their character or qualifications, have not only absorbed the whole revenue derived from the finished lines, but have brought the state annually in debt for their maintenance.

“ This career of lavish expenditure and continual extension was at length checked. The alarming increase of the state debt, the enormous excess in the cost of completing many of the works above the estimates of the engineers, and the failure of the finished lines to support by their tolls the annual charges on them for repairs and expenses, became subjects for serious consideration. Those who had from the first doubted the expediency of undertaking such a gigantic scale of improvement, became decidedly hostile to the further extension of the system, while its warmest advocates were discouraged at the prospect before them. The public voice called for a retrenchment of expenditures, and the operations were prosecuted on a reduced scale. The work on some of the lines was suspended, and was only continued on those which were necessary to complete certain connexions, or those which were deemed likely to afford immediate advantage from completion.

“ The present deranged condition of the state finances, and the utter prostration of the credit of the commonwealth, have now put a stop to the further prosecution of the public works. The time has come for serious consideration upon the means of extricating Pennsylvania from her present embarrassed condition. No remedy can be devised but that of taxing the people; and even taxation, so long as the public improvements are so managed as not to sustain themselves, will be ineffectual, unless increased from year to year. A more economical superintendence of our canals and railroads, or their transfer from the state to individuals or companies, seems to be imperatively demanded by the public interest. By such a transfer, on fair terms and under proper regulations, the state would be at once relieved from a heavy burden, while the people would still have the use and advantage of the public improvements as fully as at present.

“ But notwithstanding the present gloomy prospect of our financial affairs, and the heavy debt incurred by the commonwealth in the construction of her railroads and canals, it should not be forgotten that the advantages to the *people*, in the increased value of their property, and the creation of facilities for trade and transportation, together with the expenditure, among them, of large sums of public money, have far more than counterbalanced the burden of moderate taxation. Without the means of transportation on the public works, our agricultural, commercial, manufacturing, and mineral resources would never have been developed as they now are; and the countless millions gained by the people, through the establishment of the public improvements, would cause the public

debt to sink into insignificance, if compared with the value of the advantages resulting from them.

"In order to contrast the former times and facilities with the present, it may be mentioned, that before turnpikes were constructed, it required a good team of five or six horses, from eighteen to twenty-five days, to transport from 2500 to 3500 lbs. of goods from Philadelphia to Pittsburg. On the completion of the turnpike across the mountains, the load of a waggon was increased to 6000 or 8000 pounds, and the trip was made in twelve or fifteen days. The price of carriage varied from three or four to thirteen cents per pound, the latter being paid for several loads soon after the peace with Great Britain. Since the construction of our railroads and canals, any quantity of merchandise and produce can be transported between Pittsburg and Philadelphia, Baltimore or New York in six or seven days, at an average price, each way, of less than one dollar per 100 pounds, or one cent per pound; and the passage for travellers by canal and railroads between Pittsburg and these cities is now made in two, three, or four days, at less than half the former expense by the stage.

"It is not, however, in the construction of canals and railroads alone that the funds of of the state have been invested. Extensive appropriations have been made towards improving the navigable channels of many of our rivers and large streams; to the making of roads and the building of bridges; while subscriptions have been liberally made on the part of the commonwealth to the stock of railroad, navigation, turnpike, and bridge companies. From many of these little or no dividend is received, but still the people have the benefit of their use."—pp. 149—151.

STATE CANALS.—The *Delaware Section of the Pennsylvania canal*, at Bristol, on the River Delaware, twenty miles above Philadelphia, and thence extends up the course of that river to Easton, at the mouth of the Lehigh, where it joins the navigation of the Lehigh company. It is forty feet wide, five feet deep, and has twenty-three locks, ninety feet long by eleven feet wide, from six to ten feet in height; total lockage, 164 feet. Length of canal, sixty miles; cost, 1,374,744 dollars.

The *Eastern section* commences at Columbia, the western termination of the Philadelphia and Columbia railroad, and extends along the eastern bank of the Susquehanna river to Middletown, where the Union canal joins it, where there are locks connecting with the Susquehanna. It then continues along the eastern banks of the Susquehanna, passes through Harrisburg to Duncan's island, near the mouth of the Juniata, where it joins the Juniata section, and also with the Susquehanna division of the state canals. It is forty feet wide at top, twenty-eight at bottom, and has locks ninety feet long, and seventeen feet wide; the total rise is ninety-five feet. Length, forty-three miles.

Juniata section.—At Duncan's island, a dam across the Susquehanna gives the water for the Eastern section. The Juniata section follows the valley of the Juniata to Hollidaysburg, in Huntingdon county, where it joins the eastern termination of the Alleghany Portage railroad. There are seventeen dams on this section, and about sixteen miles of slack water navigation. The canal is of the same dimensions as the Eastern section; the locks are of the same length, and fifteen feet wide. Ascent of lockage, 576 feet; distance, 130 miles.

The *Susquehanna section.*—This canal joins the Juniata section at Duncan's island, and winds along the western bank of the Susquehanna, up that river to

Northumberland, at the junction of the north and west branches, where it unites with the north and west branch divisions. Ascent, eighty-six and a half feet; length, thirty-nine miles.

The *North Branch section* opens at Northumberland, and follows the north branch of the Susquehanna to the mouth of Lackawana, in Luzerne county, above Wilkesbarre. There is a dam across the river at Nanticoke, and the upper end of the canal is supplied with water from the Lackawana. Locks, seventeen feet by ninety feet; total lockage, 112 feet; length, seventy-three miles.

The *North Branch extension* is unfinished; it was intended to communicate with the New York state, by joining the Chenango canal, as a northern outlet for the coal and iron of Pennsylvania, and to obtain back freights of salt and gypsum. From Lackawana, it follows the north branch to Athens, in Bradford county, near the northern line of the state. The cost of work done on this extension up to December 1, 1841, amounted to 2,348,276 dollars; estimated cost of work remaining to be done, 1,298,416 dollars; total estimated cost, 3,646,692 dollars. Length of canal, ninety miles; lockage, 193 feet.

The *West Branch section* is a lateral canal from the Susquehanna section, beginning at Northumberland, and extending up the west branch of the Susquehanna, by Milton, Williamsport, and other places, to the bituminous coal region in the vicinity of Farrandsville.

Two lateral branches from the West Branch section extend, one to Lewisburg, about half a mile, and the other to Bald Eagle creek, near Lock Haven, three miles and a half in length.

The *Sinnemahoning extension* is a continuation of the West Branch canal to the mouth of Sinnemahoning creek, a distance of about thirty-six miles above Farrandsville. It is unfinished, the work being suspended in 1839.

The *Wiconisco canal* is also unfinished. It extends along the east bank of the Susquehanna, from the dam at Clark's ferry, near Duncan's island, to Millersburg, at the mouth of Wiconisco creek, a distance of twelve miles; ascent, thirty-five feet. By the act of July 13, 1842, this canal was transferred to an incorporated company, "reserving the right to the state to reclaim it after twenty years, upon paying to the company the amount expended by them in its completion."

The *Western section*, near Johnstone, the western termination of the Alleghany Portage railroad, the Western section of the canal, opens and continues down the Conemaugh and Kiskiminetas to the River Alleghany; crossing which, near the mouth of Kiskiminetas, this canal winds along the western bank of the river to Alleghany city, opposite Pittsburg, where it crosses an aqueduct, and thence runs through Pittsburg to the Monongahela river. There are ten dams on the route, and upwards of twenty miles of slack water, navigable on

their pools. Below Blairsville, the canal passes through a tunnel 817 feet in length. Descent by lockage, 471 feet; distance, 105 miles.

The *Beaver section* extends from a town of the same name, on the Ohio, up Beaver river to the Shenango, and thence up that stream to the head of slack water navigation, about six miles above Newcastle. Length, thirty-one miles; ascent, 132 feet.

A little below Newcastle, at the mouth of Mahoning creek, this section is crossed by the Mahoning canal, which extends into Ohio, and at Akron it intersects the Ohio and Erie canal. The Beaver section is only a part of a canal, intended to connect the Ohio river, by way of Conneaut lake, with Lake Erie.

The *Erie extension* is unfinished, it is divided into the *Shenango section*, commences at the head of the Beaver section, above Newcastle, and extends northward to the town of Erie. The ascent from the Shenango pool to the summit at Conneaut lake, is 287 feet; the descent thence to Lake Erie, 510 feet. The level of Conneaut lake is 419 feet above low water in the Ohio, at Beaver, and the surface of Lake Erie, ninety-one feet lower than the Ohio. Length of the Erie extension, 105 miles.

The *French Creek feeder*, is a navigable canal, twenty-seven miles in length, from French creek above Meadville to the Erie extension at Conneaut lake.

The *Franklin line* joins it at the aqueduct, seven miles below Meadville, where the water in the feeder is on a level with Conneaut lake, and gives it an extension to Franklin on the Alleghany river. Descent of lockage, 128 feet; length twenty-two miles.

PENNSYLVANIA STATE RAILROADS.—The *Philadelphia and Columbia railroad* commences at Philadelphia, crosses the Schuylkill by a viaduct about two miles from the city, and follows a western course by Downingtown and Lancaster, to Columbia on the Susquehanna, a distance of eighty-two miles. Here it joins the eastern section of the Pennsylvania canal.

The Schuylkill viaduct for the rails is 984 feet in length, it has also a way for carriages and foot passengers. Immediately west of this, the road ascends by an inclined plane, 2805 feet in length, with a rise of 187 feet, on which cars ascend and descend at the same time, by being attached to an *endless* rope, moved by a stationary engine of sixty-horse power. The railroad then ascends gradually to near the West Chester railroad, about twenty-two miles from Philadelphia, where its height is 543 feet above tide-water. The railroad then descends 293 feet, at a grade of twenty-nine feet to the mile, to the Brandywine viaduct near Downingtown; from thence it again ascends, after crossing the West Brandywine near Coatesville, over the North Valley hill, at Mine Ridge gap, by a grade increased for about three-quarters of a mile, to forty-five feet per mile. From this

height the road descends 250 feet into the Lancaster valley, by the city of Lancaster, and descends but twenty-five feet, by a route of six miles, to the Susquehanna river, Columbia.

There are several viaducts over the streams crossed by this railroad, particularly those over Valley creek and West Brandywine; the latter is 835 feet in length, and seventy-two feet above the water. Those over the Big and Little Conestoga creeks are 1412 feet and 804 feet long. The highest embankment is eighty feet, and the deepest cuttings from thirty to forty feet. The locomotive engines for the transportation of freight, are capable of drawing upwards of 100 tons each, exclusive of the weight of cars, engine, &c., or nearly 200 tons in all, at an average speed of ten or twelve miles per hour.

The *Alleghany Portage railroad* commences at Hollidaysburg, at the western termination of the Juniata canal, and crosses the Alleghany ridge at Blair's gap; thence it descends to the valley of the Conemaugh, to Johnstown, at the western division of the Pennsylvania canal. There are ten inclined planes on this railroad from Johnstown eastward, and eleven "levels," or graded lines of road, the inclination of which is from ten feet to fifteen feet to the mile, except that between Johnstown and the first plane, which has a grade of about twenty-four feet, between the eastern plane and Hollidaysburg, where the maximum grade is fifty-two feet. Blair's gap is 2325 feet above the level of mean high water of the tide on the Susquehanna; the ascent from Hollidaysburg to the summit, is 1398 feet in ten miles, and the descent to Johnstown 1171 feet in twenty-six miles and a half. There are five inclined planes on each side of the summit; the longest being the third one west of Hollidaysburg, which is 3117 feet in length, with a rise of $307\frac{1}{2}$ feet; and the shortest, the third east of Johnstown, 1480 feet in length, rising $130\frac{1}{2}$ feet.

At the head of each inclined plane, there are two stationary engines of about thirty-five horse power each, which draw up and let down, by *the endless rope*, the cars attached. Four cars, each loaded with a burden of 7000 pounds, can be drawn up at once, and as many let down at the same time, from six to ten times in an hour. On the short levels between the planes, horses are used for drawing the cars.

A viaduct over the Conemaugh, consists of a single arch of eighty feet span, at a height of seventy feet above the water of the stream. Through a ridge near the head of the first plane, east of Johnstown, there is a tunnel, 901 feet in length, twenty feet wide, and nineteen feet high. This railroad is thirty miles and a half long.

The *Gettysburg railroad*, intended to communicate between the Pennsylvania improvements and those of Maryland, from the Baltimore to the Ohio railroad, and also with the Chesapeake and Ohio canal. After expending more than 700,000 dollars, on the eastern end between Gettysburg and the summit of the south mountain, the work was suspended.

PENNSYLVANIA CANALS AND RAILROADS CONSTRUCTED BY COMPANIES.—

The *Lehigh navigation* consists of a succession of canal and slack water navigation constructed by the Lehigh company, numerous dams built across the river form navigable pools, and between these there are canals of various lengths. These works join the Delaware section of the state canal at Easton on the Delaware, and extend up the Lehigh river by Bethlehem and Allentown to Mauch Chunk, at the eastern termination of the great southern anthracite coal basin. The canals are sixty feet wide at the water line, forty-five feet at bottom, and five feet deep; locks 100 feet long and twenty-two feet wide, capable of passing boats carrying more than 100 tons; dams from 300 feet to 564 feet long, and eight feet to nineteen feet and a half high. Distance, forty-six miles and a half, with a rise in lockage of 353 feet.

From Mauch Chunk the navigation is continued up the river to Whitehaven, twenty-four miles and three quarters; and thence to the falls at Stoddartsville, thirteen miles and a half, there is a descent for boats by artificial freshets, chiefly for bringing down lumber. The distance from Mauch Chunk to the northern termination of the works, is thirty-eight miles and a quarter. Ascent, 936 feet. The locks above Mauch Chunk are of the same length as those below, and twenty feet wide; one of them has a lift of thirty feet, and can be filled or emptied in two minutes and a half. On this upper division of the work are twenty dams, from fourteen to thirty-eight feet high, and from 187 to 375 feet long. Total length of the Lehigh navigation, eighty-four miles and a half.

The *Lackawaxen canal* is an extension of the Delaware and Hudson canal into Pennsylvania. It enters the state near the mouth of Lackawaxen, and extends up that stream to Honesdale, in Wayne county, where it connects with a railroad to the Lackawana coal mines at Carbondale. Length, twenty-five miles; lockage rise, 187 feet from the Delaware to Honesdale, which is 870 feet above tide water.

The *Schuylkill navigation* commences at Fair Mount dam, near Philadelphia, and follows the Schuylkill by Norristown and Reading to Port Carbon. It opens a water carriage between the Philadelphia and the Schuylkill coal region. It was commenced in 1815, and completed in 1826. Like the Lehigh navigation, it consists of pools formed across the river, with intervening lines of canal, sometimes on the east and sometimes on the west side of the river, which the canal crosses several times. Near Reading it is intersected by the Union canal, which joins the Susquehanna, and the state canals of the interior. Length of navigation from Philadelphia to Port Carbon, 108 miles, of which fifty-eight is canal and fifty slack water. The longest line of canal on the route is twenty-two miles, called the Girard, the upper end of which is five or six miles below Reading. Width of canal, thirty-six feet at top, twenty-two at bottom, and four feet deep. Locks, eighty feet by seventeen; total ascent, 610 feet.

The *Union canal* passes from the Schuylkill, near Reading, westward up the valley of Tulpehocken creek, to the summit between the head waters of that stream and those of the Quitapahilla, a branch of the Swatara. It then descends the Swatara to the Susquehanna, near Middletown. A branch, twenty-three miles in length, serves the double purpose of a navigable canal and a feeder, and extends up the Swatara northward to Pine Grove, in Schuylkill county, from which railroads extend to the coal mines. Near the gap by which the Swatara passes through the Blue mountain, a large dam is constructed which forms a pool or reservoir several miles in extent. The feeder on the Swatara being lower than the summit level of the canal near Lebanon, water works have been constructed, which are now aided by steam engines, for the purpose of raising the water, which is conducted in a trunk several miles to the main canal. From the commencement of this canal on the Schuylkill to the summit level, the decline is forty-one miles and a quarter; ascent of lockage, 311 feet. The summit level is seven miles long, and $498\frac{1}{2}$ feet above tide water. From this to the Susquehanna is thirty-three miles and three quarters; descent, $208\frac{1}{2}$ feet. Width of canal, thirty-six feet; depth, four feet. Locks, seventy-five feet by eight feet and a half. Length of canal, eighty-two miles.

The *Susquehanna* or *Tide Water canal*, commencing at Wrightsville, opposite Columbia, and continues along the west side of the Susquehanna river to Havre-de-Grace, in Maryland. This canal opens a communication between the eastern division of the Pennsylvania canal and the tide water of Chesapeake bay. Canal, fifty feet wide, five feet deep; locks with double chamber, admitting the passage of two boats at the same time, or of a raft 170 feet long, and sixteen feet wide. Length, forty-five miles; descent, 233 feet.

The *Conestoga navigation* consists of dams and locks, on Conestoga creek, from the city of Lancaster to the Susquehanna river. Locks, 100 feet by twenty-two feet; length of navigation, eighteen miles; descent, sixty-two feet.

The *Codorus navigation*, by dams, locks, and canals on Codorus creek, from the borough of York to the Susquehanna river. Length, eleven miles.

Bald Eagle and *Spring Creek navigation*, extends from the West Branch State canal, at Lock Haven, in Clinton county, up the Bald Eagle and Spring creeks to Bellefonte, in Centre county. Length, twenty-five miles; nineteen of which are finished. Lockage, 183 feet.

Monongahela Improvement navigation, extending up that river to the Virginia line; unfinished. Length, about forty miles.

Mahoning canal, eight miles of which are in Pennsylvania, extends from the Beaver division of the State canal, near Newcastle, in Mercer county, up the valley of Mahoning river into the state of Ohio, and joins the Ohio and Erie canal at Akron, Ohio. Length, eighty-five miles.

CORPORATED RAILROADS.—There are in the city of Philadelphia and the

incorporated districts adjoining, several short railroads joining or uniting the greater railroads which approach the city in different directions.

The *City railroad* extends along Broad-street from the Columbia railroad, at Vine-street, to the Southwark railroad, at Cedar-street or South-street, one mile; with a branch down Market-street from Broad-street to Third-street, and thence down Third-street and Dock-street to the city warehouses near Dock-street wharf. Length, one mile and a quarter.

The *Southwark railroad* extends from the City railroad at South-street down Broad-street to Prime-street, and thence by the latter to the Delaware above the Navy-yard; nearly two miles. A branch of this road, half a mile in length, extends up Swanson-street to Cedar-street, near the wharf.

The *Northern Liberties* and *Penn Township railroad* branches off from the Columbia railroad and down Willow-street to the Delaware railroad, joining the Germantown, Norristown, and the Philadelphia and Trenton railroads. Length, one mile and a quarter.

The *Philadelphia and Trenton railroad*, from Philadelphia to Frankford, Holmesburg, Bristol, and Morrisville, opposite Trenton, on the Delaware. Rails across the bridge into Trenton, form a communication with the railroad from Trenton to New York. Length, about twenty-eight miles.

The *Philadelphia and Wilmington railroad* joins the Southwark railroad at Broad-street and Prime-street, in Philadelphia, crosses the Schuylkill by a viaduct, passes through Chester to the state boundary, thence to Wilmington, in Delaware, where it joins the Wilmington and Susquehanna railroad to Baltimore. Length, twenty-seven miles.

The *Philadelphia, Germantown, and Norristown railroad*, seventeen miles in length, along the eastern side of Schuylkill, by Manayunk, to Norristown, in Montgomery county. About three miles from this city, a branch leaves this road and proceeds to Germantown, three miles.

The *West Philadelphia railroad*, extends from the Schuylkill, opposite Philadelphia, north-westward, joining the Columbia railroad about eight miles from the Schuylkill. It is unfinished. The most abrupt grade is nearly fifty-seven feet, the average grade forty-three feet, per mile.

The *Valley railroad* branches from the Philadelphia and Reading railroad on the west side of the Schuylkill, near Norristown, up the valley, to intersect the Philadelphia and Columbia railroad east of Downingtown, about thirty-one miles from the city. Length, twenty miles. Maximum grade, thirty-five feet and three quarters per mile. Road unfinished.

The *West Chester railroad* branches from the Philadelphia and Columbia railroad, twenty-two miles from the city, to West Chester, about ten miles.

The *Philadelphia and Reading railroad*, joins the Columbia railroad, below the inclined plane, on the west side of the Schuylkill, near Philadelphia, extends

up that river to Pottsville, opening a line of communication between Philadelphia and the Schuylkill coal region. The whole line, from Pottsville to Philadelphia, is composed of levels and descending grades, which gives great advantages to the descending transportation. A locomotive engine of eleven tons' weight has conveyed from Reading to the Columbia railroad, near Philadelphia, 101 cars with 423 tons, at an average speed of ten miles the hour. There are three tunnels on this road; one at Flat Rock, eight miles from the city, 960 feet in length; another near Phoenixville, of 1932 feet; and the third near Port Clinton, 1600 feet. Near the second tunnel, about thirty miles from Philadelphia, the road crosses to the east side of the river by a viaduct, 288 feet in length, and twenty-four feet above the water. Length, from the Columbia railroad to Reading, fifty-four miles; from Reading to Pottsville, thirty-six miles. A branch, five miles long, from the Falls of Schuylkill, crosses eastward to the Delaware, at Richmond, about three miles from Philadelphia.

The *Little Schuylkill railroad* extends from Port Clinton, at the junction of the two main branches of Schuylkill above the Blue mountain, up the Little Schuylkill to the Tamaqua coal mines, near the south side of the Broad mountain. Ascent, 406 feet; length, twenty-three miles.

The *Mine Hill and Schuylkill Haven railroad*, extends from Schuylkill Haven, up the west branch of Schuylkill, to the coal mines in the neighbourhood of Mine hill. Length of road and branches, twenty miles.

The *Mount Carbon railroad* commences a mile below Pottsville, passes up Norwegian creek to the commencement of the Danville and Pottsville railroad, and thence extends by branches to several coal mines. Length, seven miles.

The *Schuylkill Valley railroad* commences at Port Carbon, where the Schuylkill navigation terminates, thence up the Schuylkill through the coal region to Tuscarora, ten miles. It has many branches to coal mines, the length of which is twelve or fifteen miles.

The *Mill Creek railroad* from Port Carbon to the mines about Mill creek, four miles, with branches amounting to five miles.

Danville and Pottsville railroad parts from Mount Carbon railroad three miles above Pottsville, crosses the Broad mountain by a summit 1014 feet above the level of the Susquehanna at Sunbury, and then across the valley of Mahanoy creek, and over the ridge between that stream and Shamokin creek, down which to Sunbury on the Susquehanna. On this railroad there is a tunnel 700 feet long, and seven inclined planes: one 1650 feet in length, with an ascent of 345 feet. Chain cables are used on the inclined planes instead of ropes. The eastern section is completed to Girardville, fourteen miles from Pottsville. A tunnel 2500 feet long has been cut through Bear ridge, on the Girard estate, for the purpose of obtaining coal. The western section of the road is completed from Sunbury, twenty-one miles, to the extensive coal mines, a furnace for

smelting iron with anthracite; to the far town of Shamokin: length of the railroad, forty-four miles and a half. A branch, seven miles, to Danville, on the north branch of the projected Susquehanna.

The *Little Schuylkill and Susquehanna*, or *Catawissa railroad*, extends from the termination of the Little Schuylkill railroad at Tamaqua, across the ridge dividing the waters of Little Schuylkill and Catawissa creek, thence down the valley of the latter to the town of Catawissa on the north branch of Susquehanna, about thirty-five miles. Unfinished.

It is proposed to extend this road from Catawissa to Williamsport in Lycoming county. A branch, twelve miles in length, extends from this road near the summit north of Tamaqua, down the valley of Quakake, to the Beaver Meadow railroad near the Lehigh.

INCORPORATED RAILWAYS.—The *Mauch Chunk railroad*, from the coal landing at Mauch Chunk to the summit mines. Length, nine miles. Ascent, 936 feet; highest grade, 133 feet per mile. There is also a railroad of five miles and a quarter, from Mauch Chunk to the company's coal mines on Room Run. Ascent, 534 feet.

The *Beaver Meadow railroad*, from Parryville on the Lehigh, six miles below Mauch Chunk, up the river to the mouth of Quakake creek, and thence up that stream to the Beaver Meadow mines. Length, twenty miles.

The *Hazleton railroad*, branches off from the Beaver meadow road and leads to the coal mines near Hazleton. Length, eight miles.

The *Lehigh and Susquehanna railroad*, constructed by the Lehigh Coal and Navigation company, from Whitehaven on the Lehigh to Wilkesbarre on the Susquehanna joins the North Branch canal. It has one tunnel and three inclined planes. Length, nineteen miles and three quarters.

The *Carbondale and Honesdale railroad* joins the Hudson and Delaware canal navigation on the Lackawana. It extends from Honesdale to the coal mines near Carbondale. Length, sixteen miles and a half. The summit on Moosic mountain, at an elevation of 912 feet, is passed by means of inclined planes.

The *Pine Grove railroad* extends from the Union canal navigation at Pine Grove in Schuylkill county, to the coal mines. Length, four miles. The *Lorberry* and *Swatara* railroads, to other mines in the same region, extend eight miles.

The *Lykens' Valley railroad*, from Millerstown on the Susquehanna, extends along the north side of Berry's mountain to the Wiconisco coal mines at Bear gap, in Dauphin county. Length, sixteen miles.

The *Williamsport and Elmira railroad* is completed from the West Branch canal at Williamsport, up Lycoming creek to Ralston. Length, twenty-five miles. Thence it is intended to extend northward to Elmira in New York, to join the Chemung canal. Projected length, seventy-three miles and a half.

The *Blossburg and Corning railroad*, from the bituminous coal region at Blossburg to the Chemung canal at Corning, New York. Projected length, forty miles ; part finished.

The *Harrisburg and Lancaster railroad* branches from the Philadelphia and Columbia railroad near Lancaster, and extends by Mountjoy and Portsmouth to Harrisburg, where it joins the Cumberland Valley railroad. Near Elizabethtown there is a tunnel of 850 feet. Highest grade, forty-two feet to the mile, generally less than thirty-five feet. Length, thirty-six miles.

The *Cumberland Valley railroad* commences at Harrisburg, crosses the Susquehanna, and continues westward by Carlisle, Newville, and Shippensburg to Chambersburg in Franklin county. The bridge by which this road crosses the Susquehanna has the railroad laid upon a flat roof, with carriage ways beneath. Length of road, fifty-two miles. A route for another railroad to join this, and to extend from Chambersburg to Pittsburg, has been surveyed.

The *Franklin railroad* joins the Cumberland Valley railroad at Chambersburg; thence southward by Greencastle to the state boundary, and to Hagerstown in Maryland. Length, about twenty miles. It is projected to continue this road to the Potomac.

The *York and Wrightsville railroad* extends from the western termination of the Philadelphia and Columbia railroad, across the Susquehanna to Wrightsville; thence westward to York, thirteen miles, where it intersects the Baltimore and Susquehanna railroad.

The *Baltimore and Susquehanna railroad* extends southward from York, up the valley of Codorus creek to the Maryland boundary, eighteen miles, and thence to Baltimore. Whole length, fifty-six miles.

The *Turnpike Roads and Bridges* of Pennsylvania are numerous and well made. They have been nearly all constructed by incorporated companies. Mr. Frego observes,

“That few of them have ever yielded dividends equal to the interest on the cost of construction, and most of them little more than sufficient to keep them in repair, yet they should not be considered as an improvident and wasteful expenditure of capital. The advantages resulting to those portions of the state which they connect, and through which they pass, from increased facilities of travelling, and the transportation of produce and merchandise, the additional value which they consequently give to the lands adjacent to them, the easy and direct communication afforded by their means between different sections of the country, previously separated by impassable mountains or impenetrable wilderness, have altogether far exceeded in value the cost of all the turnpikes in Pennsylvania.

“These roads are usually constructed of a bed of broken stone, from one to two feet

thick, having a convex surface so as to permit the water to drain off freely, and sufficiently wide to allow the passage of two or three carriages abreast. On each side of this artificial road is another track, commonly called the summer road, which is made on the natural soil, and being generally smoother than the stoned road, is usually preferred when the ground is dry. On the steep mountain sides the turnpikes ascend by a winding series of regularly graded slopes, seldom exceeding three or four degrees, no angle exceeding five degrees being permitted by law.

"The Philadelphia and Lancaster turnpike, sixty-two miles in length, is said to be the first road of this kind undertaken in the United States. It was commenced in 1792, and finished two years afterwards, at a cost of about 465,000 dollars. Other turnpikes have since been connected with it, forming a continuous line across the state throughout its whole length, from Trenton on the Delaware to the state of Ohio on the west, a distance of nearly 350 miles. Numerous other turnpikes intersect this main line, leading off from it in different directions, and again branching out and intersecting others, so as to form a network of communication to every part of the commonwealth, and rendering the most remote districts of comparatively easy access.

"The common roads are under the care of supervisors elected by the voters of each township, and are kept in repair by a tax laid upon the inhabitants. It is the custom in many townships for those who prefer it to work on the road to the amount of their tax, being duly notified by the supervisor when and where their services will be required. Bridges over small streams are erected at the expenses of the townships; but if the estimated cost of a required bridge appears to be larger than the township should reasonably bear, the court, grand jury, and county commissioners, may, on application, direct it to be built by the county.

"The number and excellence of the bridges in Pennsylvania is a frequent subject of remark by travellers. It would be useless for us to attempt a particular notice of the vast number erected at the expense of the several counties, over the streams within their limits; many of them being substantial and well-built structures, costing from 20,000 dollars to 50,000 dollars. Those across the Delaware, Susquehanna, Alleghany, Monongahela, and others of our large streams, amounting in number to seventy or eighty, have been mostly built by incorporated companies; and many of them are so distinguished for excellence of construction and ingenuity of combination, as well as scientific boldness and beauty of design, that it may well be doubted whether any other part of the world can compete with Pennsylvania in the art of building wooden bridges."

The following statement from the "Monthly Commercial Chronicle," in *Hunt's Merchants' Magazine*, contains the most accurate information that we have been able to procure. "The state of Pennsylvania, which failed in paying the interest of its debt, has advertised its public works, for the construction of which those debts were contracted, for sale, to take its stock at par in payment. That stock is nominally at forty cents on the dollar in the market. This being the peculiar position of the debt of the state of Pennsylvania, we will here annex a table of the leading works, with their extent, cost, and aggregate revenue and expenditures for ten years, from 1830 to 1840 inclusive:—"

Cost, Revenue, and Expenditures of the Finished Lines of Pennsylvania Canals and Railroads.

NAME AND DESCRIPTION.	Distance.	Cost.	Revenue.	Expenditure.
	miles.	dollars.	dollars.	dollars.
Eastern division of the Pennsylvania canal—Extends from Columbia to Duncan's island.....	43	1,734,958	1,047,826	422,805
Juniata Division—Extends from Duncan's island to Hollidaysburg.....	130	3,437,334	491,104	592,180
Western division—Extends from Johnstown to Pittsburgh.....	105	2,964,882	887,013	889,834
Delaware division—Extends from Bristol to Easton	60	1,374,774	586,515	638,831
Susquehanna division—Extends from Duncan's island to Northumberland.....	39	867,874	141,730	314,253
North Branch division—Extends from Northumberland to Lackawannock.....	73	1,491,894	63,559	390,624
West Branch division—Extends from Northumberland to Dunnsburg.....	72	1,708,579	60,859	333,738
French Creek division—Extends (including the feeder) from Franklin to Conneaut lake.....	45	784,754	4,767	133,979
Beaver division—Extends from Beaver to Newcastle	25	522,258	15,924	139,082
Columbia and Philadelphia railway—Extends from Columbia to Philadelphia.....	82	3,983,302	1,205,419	585,343
Railroad tolls.....			824,319	862,074
Motive power.....				436,519
Locomotives, ropes, &c.....				
Alleghany Portage railway—Extends from Hollidaysburg to Johnstown.....	38	1,783,176	413,504	293,135
Railroad tolls.....			443,480	539,507
Motive power.....				122,236
Locomotives, ropes, &c.....				
Total.....		20,653,791	6,181,624	6,694,206

In addition to this, there are the following canals in progress, and nearly completed:—

North Branch extension, from Lackawana to New York line.....	miles. 90
Erie extension, from Greenville to Erie harbour.....	63½
Wiconisco canal, from Duncan's island to Wiconisco creek.....	12½
Total miles of canals in progress.....	165½

These have cost nearly 10,000,000 dollars, making the total funded debt, with money borrowed to pay interest and other expenses, 36,331,005 dollars. The property of the state is as follows:—

The value of public improvements, estimated at cost, is....	dollars.	cts.
The state owns bank stock which cost, at par.....	29,292,165	33
The state owns turnpike and bridge stock.....	2,108,700	00
The state owns railroad stock.....	831,778	66
Money due on unpatented lands, estimated at.....	350,546	00
Total.....	1,000,000	00
	33,583,189	99

The works may become valuable, but as seen in the above table, in ten years, including a most prosperous season, the expenses exceeded the receipts 512,585 dollars, independent of the interest on the debt contracted for their construction. We have gone thus into details, because it is a novel feature in the money market for an independent state to become bankrupt, and tender its property for sale in payment.

In New Jersey the Delaware, and Morris canal was begun in 1824, and completed in 1836, and cost about 2,500,000 dollars. It extends from Easton, on the Delaware, to Jersey city, 101 miles. A large amount of coal, from the coal region of Pennsylvania, is transported on it. It has recently been widened at a great

expense. The Delaware and Raritan canal extends from New Brunswick, on the Raritan, to Bordentown, on the Delaware, below Trenton, and is forty-three miles in length. It forms part of an important communication between the cities of New York and Philadelphia. Salem canal extends from Salem creek, four miles to Delaware river.

The *NEW JERSEY railroads* are more important even than her canals. The Camden and Amboy railroad was incorporated in 1829, and completed in 1832, extending from Camden, on the Delaware, opposite to Philadelphia, to South Amboy, at the mouth of the Raritan, sixty-one miles. The New Jersey railroad was incorporated in 1832, and opened in 1836, extending from Jersey city, through Newark, New Brunswick, and Trenton, to Bordentown, where it forms a junction with the Camden and Amboy road. The Paterson railroad was incorporated in 1831, and completed in 1834, and branches off from the New Jersey railroad at Bergen hill, and extends fifteen miles to Paterson. The Morris and Essex railroad extends from Newark to Morristown, twenty miles. The Elizabethport and Somerville railroad communicates between the two places, twenty-five miles. The Camden and Woodbury railroad extends, from the one place to the other, nine miles.

In *DELAWARE* and *MARYLAND*, the Chesapeake and Delaware canal is the most important internal improvement. It crosses the northern part of the state, commencing at Delaware city (which has only forty houses), forty-six miles below Philadelphia, and extends thirteen miles and a half to Back creek, a navigable branch of Elk river. Being sixty-six feet wide at the surface, and ten feet deep, it is navigable for sloops and steamboats. The Deep Cut in this canal is four miles in length, through a hill ninety feet high. This canal was commenced in 1824, and completed in 1829, at a cost of 2,200,000 dollars. The Newcastle and Frenchtown railroad also forms a connexion between the Delaware and Chesapeake. It extends from Newcastle on the Delaware river, to Frenchtown on Elk river, is sixteen miles and a quarter long, and was finished in 1832, at an expense of 400,000 dollars.

“Two of the greatest works of internal improvement in the United States have been projected and commenced by Maryland. The first is the Chesapeake and Ohio canals, commencing at Georgetown, district of Columbia, and to extend to Cumberland, on the Potomac, and thence by Wills creek and the Youghiogheny and Monongahela rivers to Pittsburg, a distance of 341 miles and a quarter. It would require a tunnel through the Alleghany mountains four miles and eighty yards in length. The whole amount of lockage will be 3215 feet. The estimated cost is 9,347,408 dollars. The state of Maryland has subscribed 3,000,000 dollars, and the United States 1,000,000 dollars, towards the completion of the undertaking. A charter was granted by Virginia in 1824, and confirmed by Maryland and the Congress of the United States in 1825, and the work was commenced in 1828. It has been nearly completed from Georgetown to Cumberland, 185 miles, and has been extended to Alexandria.”—*U. S. Gaz.*

“The second great work is the Baltimore and Ohio railroad, designed to extend from Baltimore to Wheeling, on the Ohio, 360 miles. It was incorporated by the legislature of Maryland, Virginia, and Pennsylvania, in 1827, and commenced July 4th,

1828. The state of Maryland has subscribed to the stock 3,000,000 dollars, and the city of Baltimore 3,000,000 dollars. It is completed from Baltimore to Cumberland. The Washington branch extends thirty miles and a quarter from Potapscow river to Washington. The Baltimore and Port Deposit railroad extends thirty-six miles from Baltimore to Havre de Grace. The Baltimore and Susquehanna railroad extends fifty-six miles from Baltimore to York, Pennsylvania. The Reistertown branch railroad commences six miles from Baltimore, and extends eight miles to Reistertown. The Wilmington and Susquehanna railroad extends from Havre de Grace, thirty-two miles, to Wilmington, Delaware. The Annapolis and Elkridge railroad extends nineteen miles and three-quarters from Washington branch to Annapolis."—*U. S. Gaz.*

Philadelphia, Wilmington, and Baltimore railroad.—From the reports made January 9th, 1843, and January 8th, 1844, it appears that the whole amount of receipts for the year ending the 21st of December, 1842, were 469,858 dollars 4 cents. The whole expenses for the year, ending the same day, were 239,965 dollars 7 cents. The revenue for 1842 was 134,010 dollars 65 cents less than in 1841, and the expenses were less by 102,979 dollars 70 cents. The whole receipts for the year ending the 31st of December, 1843, were 430,434 dollars 47 cents; while the current expenses for the same period were 230,384 dollars 86 cents. It appears, by the last report, that the funded debt of the company amounted to 2,972,887 dollars 16 cents. The president alludes to the adverse circumstances of the company during the past year; but hopes, that from the favourable prospects of the country, the period is approaching when it will receive such substantial assurance of prosperity as will confirm the anticipations of the most sanguine. Of the probability of this, however, no speculations are offered.

The fifth annual report of the Philadelphia, Wilmington, and Baltimore Railroad company embraces some interesting statements. The gross receipts of the road for 1842 were 386,874 dollars; receipts on the Newcastle and Frenchtown railroad for the same period, 82,983 dollars; joint gross receipts, 469,857 dollars. The largest receipts for passengers, 38,370 dollars, were in the month of May; the largest receipts for freight, 7293 dollars, were in the month of February. The largest gross receipts, in 1841, were 603,868 dollars, being an increase of 134,010 dollars over 1842. Expenses in 1841, 342,940 dollars; expenses in 1842, 239,965 dollars. Decrease in net revenue in 1842, 31,080 dollars. The saving in expense for the last year is a very important matter, and speaks well for the management of the road.

VIRGINIA.—The Dismal Swamp canal connects Chesapeake bay with Albemarle sound, extending from Deep creek to Joyce's creek, twenty-three miles, at a cost of 879,864 dollars. It has branches of eleven miles. The Alexandria canal extends seven miles and a quarter from Georgetown to Alexandria. The James river and Kanawha canal extend 175 miles, from Richmond to Buchanan. The Richmond, Fredericksburg, and Potomac railroad extends seventy-five miles, to Aquia creek. Louisa branch, twenty-five miles from Richmond, proceeds forty-nine miles, to Gordonsville. Richmond and Petersburg railroad, from

Richmond, extends twenty-three miles, to Petersburg. Petersburg and Roanoke railroad extends from Petersburg, fifty-nine miles, to Weldon. Greenville railroad extends from near Hicks, for eighteen miles, to Gaston, North Carolina. City Point railroad extends from Petersburg, twelve miles, to City Point. Chesterfield railroad extends from Coal Mines, thirteen miles and a half, to Richmond. Portsmouth and Roanoke railroad extends from Portsmouth, eight miles, to Weldon, North Carolina. Winchester and Potomac railroad extends from Harper's ferry, thirty-two miles, to Winchester.

NORTH CAROLINA.—The Wilmington and Raleigh railroad extends from Wilmington, 161 miles and a half, to Weldon, on the Roanoke, and connects with the Portsmouth and Roanoke railroad. It was commenced in 1836, and completed in 1840. The Raleigh and Gaston railroad extends from Raleigh, eighty-five miles, to Gaston, on the Roanoke, where it unites with the Petersburg, Greenville, and Roanoke railroads. Northwest canal connects Northwest river, six miles, with the Dismal Swamp canal. Weldon canal extends twelve miles round the falls of the Roanoke. Clubfoot and Harlow canal extends from the head waters of the Clubfoot, one mile and a half, to those of Harlow creek, near Beaufort.—*U. S. Gaz.*—(Various accounts.)

The receipts of the railways for 1843 amounted to 122,108 dollars; expenses, 70,176 dollars; receipts by steamboats, 104,066 dollars; profits on both, 78,006 dollars.—*Official Returns.*

SOUTH CAROLINA has some important works of internal improvement. The Santee canal extends twenty-two miles from Charleston harbour to the Santee river, and was finished in 1802, at a cost of 650,667 dollars. Through this canal and the improvement of the Santee and Congaree rivers, a boatable communication has been opened from Charleston to Columbia. Winyaw canal extends seven miles and a half from Winyaw bay to Kinlock creek, a branch of the Santee river. The navigation of the Catawba river has been improved by five short canals, with an aggregate length of about eleven miles and a half. Saluda canal extends from the head of Saluda shoals to Granby ferry, six miles and a quarter. Besides these, there are three other short canals, to avoid the obstructions of falls or shoals in rivers.

The South Carolina railroad commences at Charleston, and extends 135 miles and three-quarters to Hamburg. This road was commenced in 1830 and completed in 1834, at a cost of 1,750,000 dollars. It has since been sold to the Louisville, Cincinnati, and Charleston Railroad company, for 2,400,000 dollars, paid for in the stock of the latter company. The entire length of this road from Charleston to Cincinnati will be 718 miles. The Branchville and Columbia railroad extends from Branchville, on the South Carolina railroad, sixty-six miles, to Columbia. This is to form a part of the Charleston, Louisville, and Cincinnati railroad.

TARIFF of Freights on the South Carolina Railroad.

To be loaded and
unloaded by the
owners.

The rate of freight between Columbia and Hamburg, will be as above; and to all intermediate stations between Branchville, Columbia, and Hamburg, where the present freight exceeds, it shall be reduced to the rate specified as above.

The company does not engage to notify consignees of the arrival of goods and produce. They are considered as delivered when they have reached the dépôt; but if not taken away, will be stored at the dépôt, at the risk of the owner.

Goods, wares, produce, and merchandise, consigned to the company's agent in Charleston, will be forwarded and shipped to any place of destination, free of commissions. The same, if intended for the interior of the Carolinas, Georgia, Tennessee, and Alabama, unless otherwise directed, will be despatched by the first waggons offering for the place to which the goods may be consigned. If destined for the Georgia railroad, they will be sent to the dépôt in Augusta immediately; provision being made, in all the above cases, for the payment of freight and expenses on the road, to the agent in Charleston, or to the company's agent at the dépôt, by whom the goods are forwarded.

GEORGIA.—This state has several important works of internal improvement. The Savannah and Ogeechee canal extends sixteen miles, from Savannah to Ogeechee river, completed, in 1829, at an expense of 165,000 dollars. The Brunswick canal extends from tide water on the Altamaha, twelve miles to Brunswick, at a cost of 500,000 dollars.

The Georgia railroad extends from Augusta, 165 miles, to De Kalb county. The Athens branch extends from the Georgia railroad, thirty-three miles, to Athens. Cost of the whole, including the Athens branch, 3,300,000 dollars. The Western and Atlantic railroad continues the Georgia railroad from De Kalb county, 140 miles, to Chattanooga, on Tennessee river, at a cost of 2,130,000 dollars. The Central railroad extends from Savannah, 197 miles, to Macon, estimated to cost 2,300,000 dollars. The Monroe railroad extends from Macon, 101 miles, to Whitehall. The Ocmulgee and Flint river railroad, seventy-six miles in length; is designed to connect the navigable waters of these rivers, so as to form a communication from the Atlantic to the Gulf of Mexico.—(See Public Works of United States hereafter.)

FLORIDA.—A railroad extends from Tallahassee, twenty-two miles, to St. Mark's. One also extends from Lake Wicomico, twelve miles, to St. Joseph, and another from St. Joseph, thirty miles, to Iola, on the Appalachicola. Several other railroads and canals have been projected.

The Muscle Shoals canal is designed to overcome the obstruction in the Tennessee river. It extends from the head of the falls, thirty-five miles and three-quarters, to Florence, and cost 571,835 dollars. But to extend the work to its completion will cost 1,361,057 dollars. The Huntsville canal extends from Triana on the Tennessee, sixteen miles, to Huntsville.

The Alabama and Florida railroad extends from Pensacola, 156 miles and a half, to Montgomery, and cost 2,500,000 dollars. The Selma and Cahawba railroad is a branch of the Alabama and Florida railroad, extending from Selma, ten miles, to Cahawba.

The Montgomery and Westpoint railroad extends from Montgomery, the northern termination of the Pensacola and Montgomery railroad to Westpoint, at the head of the rapids of the Chattahoochee river, thirty miles above Columbus. It is eighty-seven miles long. The Tuscumbia, Cortland, and Decatur railroad extends from Tuscumbia, forty-four miles, to Decatur. The Wetumpka railroad extends ten miles, and is designed to connect, when completed, the Tennessee and Alabama rivers at Wetumpka.

MISSISSIPPI.—The following works of internal improvement have been undertaken. West Feliciana railroad extends from St. Francisville, in Louisiana, on the Mississippi, twenty-seven miles and three-quarters, to Woodville in Mississippi, and cost 500,000 dollars. Vicksburg and Clinton railroad extends from Vicksburg, forty-five miles, to Jackson, the capital of the state, with a branch to

Raymond, six miles and a half. The New Orleans and Nashville railroad will extend through this state. The Mississippi railroad to extend from Natchez, 112 miles, to Jackson, is finished to Malcolm, a distance of forty miles. The Jackson and Brandon railroad is fourteen miles long, and connects these places. The Grand Gulf and Port Gibson railroad is seven miles and a quarter long, connecting the two places. Several other railroads are proposed, which are those from Natchez to Woodville, forty-one miles; from Manchester to Benton, fourteen miles; from Princeton to Deer creek, twenty miles; from Brandon to Mobile, and from Columbus to Aberdeen.

LOUISIANA.—This state has a number of important works of internal improvement. Pontchartrain railroad extends from New Orleans, four miles and a half, to Lake Pontchartrain, at a cost of 450,000 dollars. West Feliciana railroad extends from St. Francisville, twenty miles, to Woodville, Mississippi. New Orleans and Carrollton railroad extends from New Orleans, four miles and a quarter, to Lafayette. Orleans-street railroad, extends from New Orleans, four miles and a quarter, to the Bay of St. John's. The Mexico Gulf railroad, extends from New Orleans east, to Pascagoula sound. The Orleans Bank canal extends from New Orleans, six miles, to Lake Pontchartrain, and cost 1,000,000 dollars. Canal Carondelet extends from New Orleans, one mile and a half, to the Bay of St. John's. Barataria canal extends from New Orleans, eighty-five miles, to Berwick bay. Lake Veret canal extends from Lake Veret, eight miles, to Lafourche river. The New Orleans and Nashville railroad extends eighty miles in this state, and if completed, will be 564 miles in length. It is in progress.

TENNESSEE.—The internal improvements of Tennessee consist of several railroads. Lagrange and Memphis railroad extends from Memphis, on the Mississippi, fifty miles, to Lagrange, in Lafayette county. Somerville branch extends from the main road at Moscow, sixteen miles, to Somerville. The Hiwassee railroad extends from Knoxville, ninety-eight miles and a half, to the Georgia line, where it unites with the Western and Atlantic railroad of Georgia. The New Orleans and Nashville railroad is designed to pass through this state.—(See Railroads of the United States hereafter.)

KENTUCKY.—A short but most important work of internal improvement, is the Louisville and Portland canal, two miles and a half long, around the rapids in the Ohio river at Louisville. It admits steamboats of the largest class, is excavated ten feet deep, in solid limestone, and cost 730,000 dollars. The navigation of Kentucky, Licking, and Green rivers, has been extensively improved by dams and locks. The Lexington and Ohio railroad extends from Lexington to Frankfort, and is intended to be continued to Louisville. Several other railroads have been projected.

MICHIGAN.—The Illinois and Michigan canal is 100 miles in length, sixty feet wide, and six feet deep; it has fifteen locks, each 110 feet in length, and

eighteen feet in width. The canal will be navigable for boats carrying from 100 to 150 tons. Five million dollars have already been expended upon it, and 1,600,000 dollars are required to complete it. It connects the navigable waters of the Illinois river, one of the main tributaries of the Mississippi, with Lake Michigan.

The security offered to the subscribers to the new loan consists of the following property:—

	dollars.
The canal itself, which has cost.....	5,000,000
230,476 acres of canal land, valued at ten dollars per acre.....	2,304,670
Lots in Chicago, valued at.....	350,000
" Lockport, valued at.....	300,000
" Ottawa, valued at.....	350,000
" La Salle, valued at.....	500,000
" Juliet and Du Page, valued at.....	300,000
Coal beds and stone quarries, valued at.....	100,000
Total.....	9,204,670

ILLINOIS.—The Illinois and Michigan canal extends from Chicago, 106 miles, to near Peru, at the head of steamboat navigation on the Illinois. This distance includes a navigable feeder of four miles, and a few miles of river navigation. It was commenced in 1836, and is estimated to cost 8,654,337 dollars. A railroad extends from Meredosia, fifty-three miles, to Springfield. Coal Mine Bluffs railroad extends from the Mississippi river, six miles, to the coal mine. Besides these, a large system of railroads has been projected, and partly executed, the principal of which is denominated the Central railroad, extending from Cairo, at the junction of the Ohio and Mississippi, and terminating near the south termination of the Illinois and Michigan canal; and thence extending in a north-west direction to Gallena; the whole distance being 457½ miles, at an estimated cost of 3,800,000 dollars. This is designed to be intersected by railroads to the east and west, some of them crossing the state. But none of these works are yet completed.

OHIO.—The Ohio canal extends from Cleveland, on Lake Erie, 307 miles to Portsmouth, on the Ohio. It has a navigable feeder of fourteen miles to Zanesville; one of ten miles to Columbus; and one of nine miles to Lancaster; one to Athens of fifty miles; the Walholding branch of twenty-three miles; the Eastport branch of four miles, and the Dresden of two miles. This great work was begun in 1825, and was finished in 1832, at a cost of 5,000,000 dollars. The Miami canal extends from Cincinnati, 178 miles, to Defiance; where it meets the Wabash and Erie canal. The cost was 3,750,000 dollars. The whole distance to Lake Erie is 265 miles. The Warren canal, a branch of the above, extends from Middletown, twenty miles to Lebanon. The Sandy and Beaver canal is to extend from the Ohio canal, at Bolivar, seventy-six miles, to Ohio River, at the mouth of Little Beaver creek. Cost estimated at 1,500,000 dollars. The Mahoning canal extends from the Ohio canal, at Akron, eighty-eight miles, eight

miles of which are in Pennsylvania, to Beaver river, at a cost of 764,372 dollars. Milan canal extends from Huron, three miles, to Milan, to which steamboats now ascend. The Mad river and Sandusky city railroad extends from Tiffin, thirty-six miles, to Sandusky city. The Ohio railroad extends from Manhattan, forty miles, to Sandusky city.

CANALS and Roads in Ohio.

CANALS AND ROADS.	Miles.	Cost.
	number.	dollars.

INDIANA.—The greatest works of internal improvement undertaken by this state is the Wabash and Erie canal, which extends from Lafayette on the Wabash, 187 miles, to Lake Erie, at Toledo, on the Maumee bay; eighty-seven miles and a quarter of it being in Ohio, and ninety-nine miles and three quarters in Indiana. The White Water canal extends from Lawrenceburg, thirty miles, to Brookville. This canal, when completed, will connect Cambridge, on the national road, with the Ohio river, the entire length being seventy-six miles, at an estimated cost of 1,400,000 dollars. The central canal is designed to connect the Wabash and Erie canal at Peru, with the Ohio river at Evansville, passing through Indianapolis. The entire length will be 290 miles, and the estimated cost 3,500,000 dollars. Parts of this work have been completed. Terre Haute and Eel river canal will connect Terre Haute, the southern termination of the Wabash and Erie canal, with the central canal in Greene county, at a distance of forty miles and a half, and an estimated expense of 629,631 dollars. This work is not completed. The Madison and Indianapolis railroad extends from Madison, on the Ohio river, ninety-five miles to Indianapolis. It is nearly completed. Several other canals and railroads have been projected.

MICHIGAN has projected and commenced an extensive system of internal improvements. The Central railroad extends from Detroit, forty-four miles, to Ann Arbor, and when completed is designed to extend 194 miles to St. Joseph on Lake Michigan. The Erie and Kalamazoo railroad extends from Toledo, thirty-three miles, to Adrian. This road is designed to be continued until it meets the Central railroad, which it will leave at Kalamazoo and terminate at Allegan. The whole distance from Toledo to Kalamazoo is 183 miles. The Ypsilanti and Tecumseh railroad leaves the Central railroad at Ypsilanti, and

connects with the Erie and Kalamazoo railroad at Tecumseh, twenty-five miles. The Detroit and Pontiac railroad extends from Detroit, twenty-five miles, to Pontiac. Numerous other railroads have been laid out and commenced; and the Clinton and Kalamazoo canal is designed to unite the waters of Lake Michigan and St. Clair. The whole length is 216 miles, and is estimated to cost 2,250,000 dollars.

The state of Wisconsin commenced in 1838, the Portage canal, one mile and a quarter long, to connect the Wisconsin and Fox rivers, which completes a steam-boat navigation from Lake Michigan to the Mississippi. The Milwaukee and Rock river canal, sixty miles in length, to connect Rock river with Lake Michigan, is in progress.

CHAPTER XV.

INTERNAL TRADE AND NAVIGATION OF THE UNITED STATES OF AMERICA.

THE internal trade of North America has increased to its present enormous extent since the beginning of the present century, from little more than a mere interchange of manufactures for the skins of wild beasts, by those who have proceeded into the western and northern wilderness, in order to carry on the fur trade. Exclusive of this there was little internal navigation, except in carrying up the rivers, in canoes or boats, provisions and other supplies for the wood-cutters, and floating down the timber which they had felled and prepared for the markets of the sea-ports. In the same ratio as the wilderness was explored, and settlements were made, west of the Alleghany, and on the banks of the great lakes, and of the Mississippi, Ohio, Missouri, and other rivers which drain the great valleys, plains, and mountains of the west, there arose fresh resources, and prospects. Those magnificent wilds possessed all the natural elements which yield, by culture and art, sustenance and wealth to man, and accommodation and prosperity to communities. Labour, skill, implements, and capital, were directed with spirit, and judgment, to the lands, waters, forests, and minerals of those regions. Enterprise and industry opened the means of intercourse between the old and the new settlements: first by common roads, and common river boats; then by canals; and soon after by railroads and steamboats. The consequent increase of population, and of the internal navigation and trade, in less than half a century, has been unparalleled in the history of the world.

One of the most remarkable characteristics of the settlement of America, is the tendency (of which England has been the example more than any other country, except, perhaps, Flanders), of the people to reside in towns. We

believe, however, that this tendency has always kept pace, in all ages, and in all countries, with the extension of trade. For in every case where trade and manufactures have been established, and maintained,—and have increased and prospered, we find that the population and wealth have increased in about the same ratio. The wealth and population of towns have always declined along with the decrease of manufactures and commerce. Among the numerous examples of this fact, we have Venice, Augsburg, and many other once flourishing cities. In all cases of the decline of large prosperous towns,—the rents,—the agriculture,—and the value of the crops, and pastures, of the surrounding rural districts, have diminished, in at least as great a degree, as the decreased trade and riches of the cities. We believe, at the same time, that the population of the great cities of antiquity have been greatly exaggerated in numbers.

David Hume was justly of opinion that no ancient city contained as many inhabitants as London: that was about 800,000, when he wrote. He considered that there were inherent causes which would check a much greater increase of the population: even of the most favourably circumstanced towns. At that time, the means of supply, and of payment, within the bounds of any one place, might possibly justify his conclusion. When Hume wrote, cattle from the Highlands could not be brought to Smithfield in as many days as they now can be brought in as many hours. The smacks which brought salmon were often as many days, during boisterous weather, making their passage to London, as the steamers are now performing the voyage in the same number of hours. The drover followed the routes, through Scotland and England, with his cattle, where they could best bite up the grass to subsist on. They arrived lean, and were afterwards fattened by the English graziers. Splendid wood or iron steam ships of from 600 to 1000 tons, now bring the cattle fattened on the pastures of the Aberdeenshire Highlands, and on the brows of the Grampians, rapidly and direct, without losing flesh, to the quays of the Thames.

Neither the power-loom, the canal, the steam-engine, nor the railroad, nor the steam-ship, nor the splendid docks of London or Liverpool, were then contemplated by Mr. Hume. It is, therefore, not to be wondered at that he was sceptical as to the population of towns exceeding 800,000.

The first canal in England was begun by the Duke of Bridgewater, in 1760. In 1760, Hargreaves gave us the spinning jenny. Arkwright, soon after, the spinning frame. Crompton, in 1779, combined the two, and called it the *mule*. In 1785, Watt brought the steam-engine to that perfect state, for acting, which made it powerful and profitable. Cartwright then invented the power-loom, but it came only into general use in 1820.

To the Bridgewater canal, and the canals which it originated; to the steam-engine, spinning-jenny, mule, and power-loom; to coal and iron conveniently interstratified for the one to smelt the other; to the coal fields, generally, of the

north, central, and western counties, and of Wales; to the coal and iron of the Clyde; to the salt mines of Cheshire; to the copper and tin mines of Cornwall; to the perseverance and industry of the people; to the enterprise of her manufacturers, and the skill of her artisans; to her geographical position and seaports; to her fisheries, which originated her naval architecture, and her fleets; to the adventurous spirit of her princely merchants; and to the hardy intrepidity of her brave mariners, does Great Britain owe her power and prosperity; her manufacturing and commercial wealth; her ability to pay high taxation and high rents;—in despite of monopolies, protective duties, and dear food; in despite of all these *banes to national prosperity: banes to national progress*, which all countries, and none more so than the United States, would act wisely to banish from their legislation.

As to the increase of population, and the inhabited extension of settlement, in the United States, we must refer to the detailed tables which we have given. We shall now briefly view the subject, as bearing on the past, present, and future internal industry and trade of these fertile and extensive regions. From a series of articles on the internal trade of the United States, written by Mr. Scott, of Ohio, in which, although he reasons frequently on the most fallacious principles, he conveys much information, and some curious and not improbable computations, we extract the following passages:—

“In the states of Massachusetts, New York, Pennsylvania, and Ohio, the improvements of the age operated to some extent on their leading towns from 1830 to 1840. Massachusetts had little benefit from canals, railways, or steam power; but her towns felt the beneficent influence of her labour-saving machinery moved by water power, and her improved agriculture and common roads. The increase of her nine principal towns, commencing with Boston and ending with Cambridge, from 1830 to 1840, was 66,373, equal to fifty-three per cent; being more than half the entire increase of the state, which was but 128,000, or less than twenty-one per cent. The increase, leaving out those towns, was but eleven per cent. Of this eleven per cent, great part, if not all, must have been in the towns not included in our list.

“The growth of the towns in the state of New York, during the same period, is mainly due to her canals. That of the fourteen largest, from New York to Seneca, inclusive, was 204,507, or sixty-four and a half per cent; whereas, the increase in the whole state was less than twenty seven per cent, and of the state, exclusive of these towns, but nineteen per cent. Of this, it is certain, that nearly all is due to the other towns not in the list of the fourteen largest.

“Pennsylvania has canals, railways, and other improvements, that should give a rapid growth to her towns. These works, however, had not time, after their completion, to produce their proper effects, before the crash of her monetary system nearly paralysed every branch of her industry, except agriculture and the coal business. Nine of her largest towns, from Philadelphia to Erie, inclusive, exhibit a gain, from 1830 to 1840, of 84,642, being at the rate of thirty-nine and one-third per cent. This list does not include Pottsville, or any other mining town. The increase of the whole state was but twenty-one and three-quarters per cent.

“Ohio has great natural facilities for trade, in her lake and river coasts; the former having become available only since the opening of the Erie canal, in 1826, and that to little purpose before 1830. She has also canals, which have been constructing and coming gradually into use since 1830. These now amount to about 760 miles. For the last five years, she has also constructed an extent of M^rAdam roads exceeding any other state,

and amounting to hundreds of miles. Her railways, which are of small extent, have not been in operation long enough to have produced much effect. From this review of the state, it will not be expected to exhibit as great an increase in town population, from 1830 to 1840, as will distinguish it hereafter. The effects of her public improvements, however, will be clearly seen in the following exhibit. Eighteen of her largest towns, and the same number of medium size and average increase, contained, in 1830, 58,310, which had augmented, in 1840, to 138,916; showing an increase of 138 per cent. The increase of the whole state, during the same period, was sixty-two per cent. The north-west quarter of the state has no towns of any magnitude, and has but begun to be settled. This quarter had but 12,671 inhabitants in 1830, and 92,050, in 1840.

“The increase of the twenty largest towns of the United States, from New York to St. Louis, inclusive, from 1830 to 1840, was fifty-five per cent, while that of the whole country was less than thirty-four per cent. If the slave-holding states were left out, the result of the calculation would be still more favourable to the towns.

“The foregoing facts clearly show the strong tendency of modern improvements to build towns. Our country has just begun its career; but as its progress in population is in a geometrical ratio, and its improvements more rapidly progressive than its population, we are startled at the results to which we are brought, by the application of these principles, to the century into which our inquiry now leads us.

“In 1840, the United States had a population of 17,068,666. Allowing its future increase to be at the rate of thirty-three and one-third per cent, for each succeeding period of ten years, we shall number, in 1940, 303,101,641. Past experience warrants us to expect this great increase. In 1790, our number was 3,927,827. Supposing it to have increased each decade, in the ratio of thirty-three and one-third per cent, it would, in 1840, have amounted to 16,560,256; being more than 500,000 less than our actual number as shown by the census. With 300,000,000 we should have less than 150 to the square mile for our whole territory, and but 220 to the square mile for our organised states and territories. England has 300 to the square mile. It does not, then, seem probable that our progressive increase will be materially checked within the 100 years under consideration. At the end of that period, Canada will probably number at least 20,000,000. If we suppose the portion of our country, east and south of the Apalachian chain of mountains, known as the Atlantic slope, to possess at that time 40,000,000, or near five times its present number, there will be left 260,000,000 for the great central region between the Apalachian and Rocky mountains, and between the Gulf of Mexico and Canada, and for the country west of the Rocky mountains. Allowing the Oregon territory 10,000,000, there will be left 250,000,000 for that portion of the American states lying in the basins of the Mobile, Mississippi, and St. Lawrence. If, to these, we add 20,000,000 for Canada, we have 270,000,000 as the probable number that will inhabit the North American valley at the end of the one hundred years, commencing in 1840. If we suppose one-third, or 90,000,000 of this number to reside in the country as cultivators and artisans, there will be 180,000,000 left for the towns—enough to people 360, each containing 500,000. This does not seem so incredible as that the valley of the Nile, scarcely twelve miles broad, should have once, as historians tell us, contained 20,000 cities.

“But, lest 100 years seem too long to be relied on, in a calculation having so many elements, let us see how matters will stand fifty years from 1840, or forty-seven years from this time. The ratio of increase we have adopted cannot be objected to as extravagant for this period. In 1890, according to that ratio, our number will be 72,000,000. Of these, 22,000,000 will be a fair allowance for the Atlantic slope. Of the remaining 50,000,000, 2,000,000 may reside west of the Rocky mountains, leaving 48,000,000 for the great valley within the states. If, to these, we add 5,000,000 as the population of Canada, we have an aggregate of 53,000,000 for the North American valley. One-third, or say 18,000,000, being set down as farming labourers and rural artisans, there will remain 35,000,000 for the towns, which might be seventy in number, having each 500,000 of souls. It can scarcely be doubted that, within the forty-seven years, our agriculture will be so improved, as to require less than one-third to furnish food and raw materials for manufacture for the whole population. Good judges have said that we are not now more than twenty or thirty years behind England in our husbandry. *It is certain that we are*

- *rapidly adopting her improvements in this branch of industry; and it is not to be doubted, that very many new improvements will be brought out, both in Europe and America, which will tend to lessen the labour necessary in the production of food and raw materials.*

"The tendency to bring to reside in towns all not engaged in agriculture that machinery and improved ways of intercourse have created, has already been illustrated by the example of England and some of our older states. Up to this time our North American valley has exhibited few striking evidences of this tendency. Its population is about 10,500,000; but, with the exception of New Orleans, Cincinnati, and Montreal, it has no large towns. In Ohio, the oldest (not in time but in maturity) of our western states, the arts of manufacture have commenced their appropriate business of building towns. Cincinnati, with its suburbs, has (1840) upwards of 50,000 inhabitants; a larger proportion of whom are engaged in manufactures and trades, than of either of the sixteen principal towns of the union, except Lowell. The average proportion so engaged in all these towns, is 1 to 8.79. In Cincinnati, it is 1 to 4.50. Indeed, our interior capital has but two towns (New York and Philadelphia) before her, in number of persons, engaged in manufactures and trades. Our smaller towns, Dayton, Zanesville, Columbus, and Steubenville, having each about 6000 inhabitants, have nearly an equal proportion engaged in the same occupation.

"These examples are valuable only as indicating the direction to which the industry of our people tends, in those portions of the west, where population has attained a considerable degree of density. Of the 10,500,000 now inhabiting this valley, little more than 500,000 live in towns; leaving about 10,000,000 employed in making farms out of the wilds, and producing human food and materials for manufactures. Even since the late period when these remarks were written, many of the interior towns have greatly increased in population.

"When, in 1890, our number reaches 53,000,000, according to our estimate, there will be but one-third of this number (to wit, 18,000,000) employed in agriculture and rural trades. Of the increase up to that time (being 42,500,000), 8,000,000 will go into rural occupations, and 34,500,000 into towns. This would people sixty-nine towns, with each 500,000.

"Should we, yielding to the opinion of those who may believe that more than one-third of our people will be required for agriculture and rural trades, make the estimate on the supposition that one-half the population of our valley, forty-seven years hereafter, will live on farms, and in villages below the rank of towns; the account will stand thus: 26,500,000 (being the one-half of 53,000,000 in the valley) will be the amount of the rural population; so that it must receive 16,500,000 in addition to the 10,000,000 it now has. The towns, in the same time, will have an increase of 26,000,000, in addition to the 500,000 now in them. Where will these towns be, and in what proportion will they possess the 26,500,000 inhabitants?

"One of them will be either St. Louis or Alton. Every body will be ready to admit that. Still more beyond the reach of doubt or cavil, is Cincinnati. We might name also Pittsburg and Louisville; but we trust that our readers, who have followed us through our former articles, are ready to concur in the opinion that the greatest city of the Mississippi basin will be either Cincinnati or the town near the mouth of the Missouri, be it Alton or St. Louis. Within our period of forty-seven years, we have no doubt it will be Cincinnati. She is now in the midst of a population so great and so thriving; and, on the completion of the Miami canal, which will be within two years, she will so monopolise the exchange commerce at that end of the canal between the river and lake regions, that it is not reasonable to expect she can be overtaken by her western rival for half a century.

"But such has been the influx of settlers within the last few years to the lake region, and so decided has become the tendency of the productions of the upper and middle regions of the great valley to seek a market at and through the lakes, that we can no longer withstand the conviction that, even within the short period of forty-seven years, a town will grow up on the lake border greater than Cincinnati. The staple exports, wheat and flour, have for years so notoriously found their best markets at the lake towns, that every cultivator, who reasons at all, has come to know the advantage of having his farm as near

as possible to lake navigation. This has, for some years past, brought immigrants to the lake country from the river region of these states, and from the states of Pennsylvania, Maryland, and Virginia, which formerly sent their immigrants mostly to the river borders. The river region, too, not being able to compete with its northern neighbour in the production of wheat, and being well adapted to the growth of stock, has of late gone more into this department of husbandry. This business, in some portions, almost brings the inhabitants to a purely pastoral state of society, in which large bodies of land are of necessity used by a small number of inhabitants. These causes are obviously calculated to give a dense population to the lake country, and a comparatively sparse settlement to the river country. There are other causes not so obvious, but not less potent or enduring. Of these, the superior accessibility of the lake country from the great northern hives of emigration, New England and New York, is first deserving attention. By means of the Erie canal to Oswego and Buffalo, and the railway from Boston to Buffalo, with its radiating branches, these states are brought within a few hours' ride of our great central lake; and at an expense of time and money so small, as to offer but slight impediment to the removal of home, and household gods. The lakes, too, are about being traversed by a class of vessels, to be propelled by steam and wind, called Ericson propellers, which will carry immigrants with certainty and safety, and at greatly reduced expense.

"European emigration hither, which first was counted by its annual thousands, then by its tens of thousands, has at length swelled to its hundred thousands, in the ports of New York and Quebec. These are both but appropriate doors to the lake country. It is clear, then, that the lake portion will be more populous than the river division of the great valley."

These and the following remarks must be considered as speculative. Some scarcely probable, though none are impossible.

"It has been proved that an extensive and increasing portion of the river region seeks an outlet for its surplus productions through the lakes. In addition to the proof given on that subject, we will compare the exports, in bread-stuffs and provisions, of New Orleans and Cleveland—the former for the year beginning the 1st of September, 1841, and ending the 31st of August, 1842; and the latter for the season of canal navigation, in 1842. All the receipts of Cleveland, by canal, are estimated as exports; as there is no doubt that she receives, coastwise and by waggon, more than enough to feed her people. The exports from New Orleans of the enumerated articles, and their price, are as stated in No. 4, vol. vii., of this magazine. Of the articles, then, of flour, pork, bacon, lard, beef, whiskey, corn, and wheat—

	dollars.
New Orleans exported to the value of	4,446,989
Cleveland	4,431,739

"The other articles of bread-stuffs and provisions received at New Orleans during that year, from the interior, are of small amount, and obviously not sufficient for the consumption of the city. Not so with Cleveland. The other articles of grain and provision, shipped last year from this port, added to the above, will throw the balance decidedly in her favour. If we suppose, what cannot but be true, that all the other ports of the upper lakes sent eastward as much as Cleveland, we have the startling fact, that this lake country, but yesterday brought under our notice, already sends abroad more than twice the amount of human food that is shipped from the great exporting city of New Orleans, the once-vaunted sole outlet of the Mississippi valley.

"Two short canals—one of about 100 miles, connecting the Illinois canal with the Mississippi, at or near the mouth of Rock river; and the other of about 175 miles, connecting the southern termination of the Wabash and Erie canal, at Terre Haute, with the Mississippi, at Alton—would, with the canals already finished or in progress, secure to the lakes not less, probably, than three-fourths of all the external trade of the river valley. With the Wabash and Erie, and the Miami canal, brought fairly into operation, the lakes will make a heavy draft on the trade of the river valley; and every canal, and railroad, and good highway, carried from the lakes, or lake improvements, into that valley, will add to the draft. The lake towns will then not only have a denser population in the region immediately about them, and monopolise all the trade of that region, but they will have at least half the trade of the river region. They will be nearer and more accessible to the great marts of trade and commerce of the old states and the old world; and this advantage will be growing, in consequence of the progressive removal of impediments to navigation between the lakes and the ocean.

"Long within the period under consideration, the position of Cleveland will be much more

favourable for concentrating the business of the surrounding country than that of Buffalo. *Canada will, before that time, form a part of our commercial community, whether she be associated with us in the government or not. She will then have about 5,000,000 of people. The American shores of the lakes lying above the latitude of Cleveland will be still more populous.*

"Cleveland is the lake port for the great manufacturing hive at the head of the Ohio river—so made by the Mahoning canal, which connects her with Pittsburg. She commands, and she will long command, by means of her 500 miles of canal and slack-water navigation, the trade of a part of western Pennsylvania, most of western Virginia, and nearly all the east half of the state of Ohio, in the intercourse of their inhabitants with the lake coasts, the eastern states, Canada, and Europe. Her position is handsome; and although her water-power is small, the low price of coal will enable her to sustain herself as a respectable manufacturing town. Her harbour, like that of Buffalo, though easy of entrance, is not sufficiently capacious. If coal should not be found on Lake Huron, more accessible to navigation than the beds on the canal, south of Cleveland, this article will greatly increase her trade with the other lake ports. It is now sold on her wharfs at eight cents per bushel.

"A glance at the map of the country will suffice to show that Buffalo is not well situated to be a place for the exchange of agricultural productions of the cold regions for those of the warm regions of the valley. In that respect, Cleveland, though not unrivalled, is clearly in a better position than Buffalo. As a point for exchanging the products of the field for manufactured goods, Buffalo will not probably, for any long time, have the advantage of Cleveland. Such traders as live within the influence of the canals and rivers that pour their surplus products into Cleveland, and stop short of New York and Boston, will, it seems to us, be more likely to purchase in Cleveland than in Buffalo. Not every man who supplies a neighbourhood with store-goods relishes a voyage on the sometimes tempest-tossed waters of the lake; and, as we before remarked, Buffalo now being but a few hours' ride from New York or Boston, by a pleasant and safe conveyance, will hardly stop many purchasers of goods from those great markets. On the completion of the Canadian canals, Cleveland will have the advantage of Buffalo, in foreign trade, for the following reasons:—Her articles of export will be cheaper; and, by that time, as we believe, more abundant. By means of her canals and roads, Cleveland is a primary gathering-point of these articles. Not so Buffalo. To arrive at her store-houses, these products must be shipped from the store-houses of other ports up the lakes, where they must be presumed to bear nearly the same price as at Cleveland. The cost of this shipment, together with a profit on it, will then be added; and, by so much, enhance their price in Buffalo.

"Is it probable, that within the period under consideration, Cleveland will have successful rivals in Maumee, Detroit, or Chicago?

"We dare say that when the people of the city of old and renowned English York were informed, that in the wilds of America, some settlers had named their collection of rude houses New York, they felt no other emotion than contempt, and treated the presumptuous ambition of the settlers with derision. It is probable that the inhabitants of old English Boston held in like contempt the assumption of the name of their town by those who planted the capital of New England. Who, forty-seven years ago, would not have ridiculed the opinion, if any one had been visionary enough to express it, that, within that time, there would grow up, in the valley of the Ohio, a city containing 50,000 inhabitants; and that within the same period, that part of the north-western territory, now composing the state of Ohio, would contain nearly 2,000,000 of people? We then had, as a basis of increase, but 4,000,000; whereas it is now over 18,000,000;—and, including Canada, near 20,000,000. For the past forty-seven years, our growth has been from 4,000,000 to near 20,000,000. During the next forty-seven years it will be, according to our estimate, from near 20,000,000, to 77,000,000; or, according to the more elaborate and probably more correct estimate of Professor Tucker, 55,000,000. This increase will certainly make it necessary that many towns, now small, should become great; and sensible men, when contemplating their probable destiny for half a century in advance, will look at the natural and artificial advantages of our lake towns, rather than at the few thousands, more or less, of present population. The towns under consideration are all destined to become large. The leading advantages of Cleveland have been already stated. Detroit has a pleasant site, and a noble harbour. A few M'Adam roads, leading north, north-west, and west, into the interior, would give her the direct trade of a large and fertile portion of Michigan. Until such roads, or some reasonably good substitute, are made, the railways leading north and west will, at least while they are new and in good order, make the chief gathering points of trade at their interior terminations, and at convenient points on their line. Pontiac, Ypsilanti, Ann Arbor, and other towns west, will cut off from Detroit, and centre in themselves the direct trade with the farmers, which, with good waggon-roads, without the railways, would have centered in Detroit. One train of cars will now bring to her warehouses what would have been brought to her stores by 100 waggons.

"Maumee has a harbour capacious enough to accommodate the commerce of a great city. Good harbours may be made, without a very heavy cost, at Cleveland and Chicago, either by excavating the low grounds bordering their present harbours, or by break-waters and piers in the lakes

outside. Some expenditure will also be needed to deepen the entrance into the Maumee harbour, and to remove obstructions within it. In water-power, Maumee has greatly the advantage over her rivals. Cleveland has but a small amount; whereas, Maumee has it to an extent unrivalled by any town on the lake borders, above Buffalo—and it is so placed, as to possess the utmost availability. Along her harbour, for thirteen miles, the canal passes on the margin of the high bank that overlooks it. This canal—a magnificent mill-race, averaging near seven feet deep, and seventy feet wide at the water-line—is fed from the Maumee river, seventeen miles above the head of the harbour, and is carried down on the level of low water in the river above, for twenty-two miles, to a point two miles below the head of the harbour; where it stands on a table-land, sixty-three feet above the harbour. Descending, then, by a lock seven feet, the next level is two miles long, and stands sixty-six feet above the harbour. Descending again, by a lock, seven feet, the level below is three miles and a half long, and stands forty-nine feet above the harbour. Again descending, within the city of Toledo, by four locks, thirty-four feet, the next and last level is nearly five miles long, and stands fifteen feet above the harbour. At many points of these thirteen miles, the water may be used conveniently from the canal to the harbour; and at most of these points, it may be used directly on the harbour.

“In the exchange of agricultural products of a warm and of a cold climate, Cleveland, by her canals and her connexion with the Ohio, can claim south, as against the Miami canal, no farther than western Virginia and eastern Kentucky. Maumee will supply the towns on the lakes Erie, Huron, and probably Ontario, with cotton, sugar, molasses, rum (may its quantity be small), rice, tobacco, hemp (perhaps), oranges, lemons, figs, and, at some future day, such naval stores as come from the pitch-pine regions of Tennessee, Mississippi, and Louisiana. Chicago will furnish a supply of the same articles to Lake Michigan, Lake Superior, when that lake becomes accessible to her navigation, and perhaps the northern portion of Lake Huron.

“Maumee will have in this trade the chief control of not less than 100,000 square miles—say 12,000 in Ohio, 30,000 in Kentucky, 30,000 in Indiana, 10,000 in Illinois, 13,000 in Tennessee, 5000 in Mississippi and Alabama, and 5000 in Michigan; to say nothing of her claim on small portions of Missouri and Arkansas. This domain is half as large as the kingdom of France, and twice as fertile. The Miami canal, connecting Maumee with Cincinnati, will, with that part of the Wabash and Erie, which forms the common trunk after their junction, be 235 miles long. The Wabash and Erie canal, from Maumee to Terre Haute, will be 300 miles long. Of this, all but thirty-six miles, at its northern extremity, will be in operation the present season. By means of these canals, and the rivers with which they communicate, great part of this extensive region will enjoy the advantage of a cheap water transport for its rapidly increasing surplus.

“Chicago, on the completion of the Illinois canal, may command, in its exchange of agricultural for manufactured products, an extent of territory as large as that controlled by Maumee.”

CHAPTER XVI.

AMERICAN STEAM NAVIGATION—TRADE OF THE RIVER HUDSON—CANALS AND RAILWAYS.

UNDER the description of New York, will be found an account of the trade of that port. Its importance, however, depends on the trade and navigation of the Hudson, of the canals and railroads which communicate between this river and with the rivers and lakes of the north and west—the statistics of which we have condensed from various official returns, and from various *statements*.

In 1782, James Rumsey, of Virginia, invented a plan for propelling boats by steam, and in 1784 obtained from the legislature of Virginia the exclusive right of navigating with such boats. In 1778 he published his project, with numerous certificates from some of the leading characters in Virginia, among whom was General Washington. His project asserted that a steamboat was actually con-

structed, which moved with half her burden on board, at the rate of three or four miles an hour, against the current of the Potomac, although the machinery was in a very imperfect state.

In 1785, John Fitch, a poor uneducated watchmaker in Philadelphia, conceived the design of propelling a boat by steam. He applied to Congress for assistance, but was refused; he offered, without success, his invention to the Spanish government, to be used in the navigation of the Mississippi. A company was formed for the building of a steamboat, and in 1788, his vessel was launched on the Delaware.

Mr. Fitch, instead of wheels, used oars, which worked in frames. When the boat was ready for trial, she started off for Burlington. "Those," says Judge Hall, "who had sneered, began to stare, and they who had smiled in derision, looked grave." Away went the boat, and the happy inventor triumphed over the scepticism of an unbelieving public. The boat performed her trip to Burlington, a distance of twenty miles; but unfortunately burst her boiler in rounding to the wharf at that place, and the next tide floated her back to the city. Fitch persevered, and with great difficulty procured another boiler. After some time, the boat performed another trip to Burlington and Trenton, and returned in the same day. She is said to have moved at the rate of eight miles an hour; but something was continually breaking, and the unhappy projector only conquered one difficulty to encounter another. Fitch became embarrassed with debt, and was obliged to abandon the invention, after having satisfied himself of its practicability.

This ingenious man wrote three volumes, which he sealed up, in manuscript, and deposited in the Philadelphia library, to be opened thirty years after his death. It is recorded that he died and was buried near the Ohio. His three volumes were opened about twelve years ago, and were found to contain his speculations on mechanics. He detailed his embarrassments and disappointments. "He confidently predicted the future success of the plan, which, in his hands, failed only for the want of pecuniary means. He prophesied that in less than a century we should see the western rivers swarming with steamboats; and then expressed his wish to be buried on the shores of the Ohio, "where the song of the boatman would enliven the stillness of his resting-place, and the music of the steam-engine soothe his spirit." A feeling very natural to the mind of an ardent projector, whose whole life had been devoted to one object; but which it was not his fate or fortune to accomplish. In one of his journals he says, "the day will come when some more powerful man will get fame and riches from my invention; but nobody will believe that *poor John Fitch* can do any thing worthy of attention." In less than thirty years after his death, his predictions were verified. He died about the year 1799.

NAVIGATION ON THE HUDSON.

Exclusive of the splendid steamships for passengers, the Hudson is navigated by vessels of nearly all descriptions for the conveyance of goods. Of the principal passenger steamships, we have the following description of the morning and evening lines which ply between New York and Albany.

The Troy, and Empire, of the Morning Line of Steamers, form the morning line between New York and Albany, leaving either place at seven o'clock. The *Troy* was built in 1840, is 294 feet long, with twenty-eight feet breadth of beam, or sixty-one feet extreme breadth, and measures 750 tons' burden. She has two patent horizontal steam-engines, low pressure, and is fitted up exclusively for a day boat.

The *Empire* was completed in 1843, is 330 feet in length, thirty-one feet in breadth of beam, or sixty-two feet extreme breadth, with a measurement of 1012 tons. She is fitted up as a day or night boat, and has fifty state-rooms, a saloon, 200 feet long and seventeen feet wide, on her promenade deck, with two patent horizontal half beam low-pressure engines.

The *Troy* and *Empire* are built on the most approved model, in the most substantial manner, and of the best materials. They are propelled by powerful low-pressure steam engines. Although appointed in a neat and plain style of finish, they are surpassed by none, either for comfort or convenience. The cabins, saloons, and rooms, are spacious, airy, chaste, and comfortable.

The common subordinate officers are courteous, efficient, and attentive; the crews active in their duties, and obliging to the traveller; the servants neat, civil, and attentive; and the stewards' department will bear as favourable comparison with other parts of those floating palaces as any other in the United States, and that is to say with any in the world.

The People's Line consists of the steamboats *Knickerbocker*, *South America*, *Rochester*, *North America*, and *Utica*, forming two daily evening lines between New York and Albany; one at five o'clock, p. m., stopping at the intermediate landings; and the other at seven o'clock, p. m., which proceeds direct, without landing.

The *Rochester* is 275 feet long, and twenty-five feet beam. She has, in her main cabins below, 300 berths, fifty in the ladies' saloon on the main deck, which is eighty feet in length, and fifty-two in a suite of twenty-six state-rooms on the upper deck, which, together with two large rooms on the guards, afford sleeping accommodations for about 450 persons.

The *South America* is 275 feet long, twenty-seven feet wide, nine feet six inches deep, and measures 640 tons. She has 200 berths in the gentlemen's

cabin, forty-eight in the ladies' saloon, which is eighty-one feet in length on the main deck aft, and fifty-two in twenty-two splendid state-rooms, which enclose a fine sitting-room on the upper deck.

The *North America* is 250 feet long, twenty-six feet beam, and nine feet depth of hold. She has accommodations in her cabins and state rooms for about 300 persons.

The steamboat *Utica* is used as a spare boat, and, in the winter season, for hard service, has rendered herself celebrated for her formidable encounters with the ice. She is 200 feet in length, and twenty-three in breadth, and can accommodate about 300 persons with berths.

The proprietors of this line have spared neither pains nor expense in the construction and fitting out of these boats. They have adopted all the new improvements which have been proved to lessen the risk of accident, or add to the comfort and convenience of passengers. The *Knickerbocker* is 325 feet long, thirty-two feet wide, nine feet nine inches depth of hold, and will measure 1042 tons; a greater amount of tonnage than any other American steam vessel. Her engine was built at the Phoenix foundry. The cylinder is sixty-five inches in diameter, and ten feet stroke. The main water-wheel shafts are of wrought iron, forged at Cold Spring, New York, are sixteen inches in diameter, and weigh 31,760 lbs. The boilers are made for burning anthracite coal, aided by a blast from blowers, driven by two small engines. The water-wheels are thirty-two feet in diameter, and eleven feet face.

The hull is built of the best materials, well fastened, and unusually strong, in order that she may run, if necessary, on other waters than the Hudson. The main cabins below are *three hundred feet* in length, and are furnished with *three hundred berths, sixty of which are in state-rooms*. The ladies' saloon is ninety feet long, twenty-nine feet wide, and has sixty-four berths, twenty-four of which are in twelve state-rooms. On the upper deck, there are fifty-six state-rooms, extending on the sides of the boat from the pilot's wheel to the promenade deck, between which is a large saloon, intended for a ladies' and gentlemen's sitting-room. Her state-rooms number, altogether, 103, twelve of which are in the ladies' cabin, thirty in the dining cabin below, fifty-six on the upper deck, and five on the main deck.

An account of one of her voyages against the stream of the Hudson, to Albany, is given as follows, viz.:—

	Miles.	Hours.	Minutes.
Left State Prison Dock, New York.....	2	2	5
Passed Yonkers	18	4	55
" Caldwell's	44	4	11
" West Point	52	4	35
" Newburgh	60	5	3
" Poughkeepsie	78	5	49
" Catskill	115	7	43
" Hudson	120	7	57
" Albany	150	9	55

Deducting detentions, as stopping for steamboats Troy and Columbia, in expectation of receiving the mayor, and other guests from Albany, and for repairing the blower-engine, seventeen minutes, her running time, from dock to dock, was but seven hours and thirty-three minutes. .

In 1840, there were twenty steam-packets and fifty steam tugs, plying regularly between New York and Albany, and the intermediate places on the Hudson.

The vessels belonging to the New Jersey Steam Navigation Company are described as new and splendid ships. They ply from New York to Stonington, from which there is a railway to Boston.

LONG ISLAND SOUND is navigated by magnificent and powerful steam ships, especially the New York and Norwich line, which form a quick and pleasant intercourse between New York and Boston, by means of the steamboats to Norwich, and the railway from the latter to Boston.

Steam ships traverse the American shores from Maine to the mouth of the Mississippi.

The steamboats on the Delaware, Schuylkill, and those plying on the Chesapeake, are generally powerful vessels.

CARRYING TRADE OF THE NEW YORK CANALS.

From the opening of the Erie and Champlain canals to the present time, the interior trade has steadily increased, and it now employs an amount of inland navigation tonnage larger than that of all the foreign and domestic shipping, entering and departing from the city of New York.

The following table of the population and prosperity of the state and city of New York, for fifty years, exhibits the rapid increase of wealth which followed the opening of its inland navigation.

Y E A R S.	Population of the State.	Population of the City.	Real and Personal Estate of the State.	Real and Personal Estate of the City.
	number.	number.	dollars.	dollars.
1790.....	340,120	33,131		
1800.....	586,050	60,489		
1810.....	959,049	96,273		
1814.....		95,519	281,838,057	77,398,243
1816.....	1,043,236	95,519		82,074,700
1817.....			323,406,505	78,895,735
1818.....			314,913,695	80,154,091
1819.....			281,018,280	79,113,065
1820.....	1,372,812	123,706	256,021,494	69,530,753
1821.....			241,393,232	68,285,070
1822.....			245,626,878	71,289,144
1823.....			275,742,636	70,940,820
1824.....			274,481,560	83,075,676
1825.....	1,616,458	166,086	314,787,970	101,160,046
1830.....	1,919,404	203,007	364,715,830	125,288,518
1835.....	2,174,517	270,089	514,329,941	218,723,703
1840.....	2,429,476	312,932	641,359,818	252,135,515

From the commencement of the Erie canal, in 1817, to its completion in 1825, nine years, the increase of population in the city of New York was seventy-four per cent, but the valuation of real and personal estate was only a million more in 1824 than it was in 1816.

The increase of population in the first five years, subsequent to the completion of the Erie canal was twenty-two per cent, and of real and personal estate twenty-four per cent. The increase of population in the fifteen years immediately preceding the completion of the canal, was seventy-two per cent.

Increase of population in fifteen years after the completion of the canal, or from 1825 to 1840, eighty-eight per cent, and of property 149 per cent. The above comparisons are no less remarkable as applied to the population and property of the whole state.

The opening of the Erie canal has advanced the commerce of the upper lakes from comparative insignificance to the foremost rank. Prior to 1818, there were no steamboats on the upper lakes, and the aggregate of American tonnage was 2068 tons. The tonnage owned on the Canada side was inconsiderable.

From 1817 to 1825, there were but three steamboats launched upon the upper lakes. The aggregate tonnage in 1825, including steamboats, was about 2500 tons. In 1840, the aggregate tonnage of steamboats alone exceeded 17,000 tons; and of other craft there was about 18,000 tons. There are about sixty steamboats now employed on the upper lakes, and the number of other vessels is 225.

BUSINESS on the New York State Canals.

RECAPITULATION.

Total value of property received at Albany by canals	8,419,859 70
Ditto ditto ditto at West Troy, ditto	4,317,823 82
	12,737,683 52

In the above estimate, property that entered the river at Waterford is not included. This would increase the amount to at least 13,000,000 dollars.

The tonnage of the canals, whether in boats or rafts, having reference to its source, naturally falls under five general heads of classification, as follows: 1st, the products of the forest; 2nd, agriculture; 3rd, manufactures; 4th, merchandize; 5th, other articles.

We have prepared, from the reports of the commissioners of 1841, 1842, and 1843, the following table, which exhibits a comparative view of the amount of toll received on each canal, during the season of navigation, in each of those years, as follows :—

C A N A L S.	1843		1842		1841	
	dollars	cts.	dollars	cts.	dollars	cts.
Erie.....	1,880,314	55	1,568,940	56	1,813,650	58
Champlain.....	102,308	50	95,957	54	117,841	14
Oswego.....	36,203	93	31,222	19	38,344	22
Cayuga and Seneca.....	19,417	38	16,948	16	23,583	37
Chemung.....	9,726	56	7,702	05	9,396	42
Crooked Lake.....	1,328	18	989	39	2,017	32
Chenango.....	16,194	75	13,615	38	18,815	48
Genesee valley.....	15,291	78	13,204	11	9,927	69
Oneida Lake.....	507	74	462	63	462	02
Seneca River Towing Path.....	296	80	149	51	844	58
Total.....	2,081,500	17	1,749,197	52	2,034,882	82

There is an increase in the tolls of 1843, compared with the year 1842, of 332,394 dollars. Of this increase, 209,820 dollars, or sixty-three per cent, is on descending, and 122,574 dollars or thirty-six per cent, is on ascending freight.

The total movements of property on all the canals, for the year of navigation, of 1843, showing the value at the place of shipment, the tons of, and tolls on each article, is given in the following statement :—

Tons and Value of Articles transported on the Canals, in 1843.

The total tonnage of all the property transported on the New York canals, ascending and descending, its value and the amount of tolls collected for 1843, was 1,512,430 tons, 76,276,909 dollars value, 2,081,599 dollars tolls.

The whole quantity of wheat and flour, that came to the Hudson river, with the aggregate market value of the same, and the amount of tolls received on all the wheat and flour transported on the canals, for 1843, as follows:—248,780 tons, 10,283,454 dollars value, 731,816 dollars tolls.

The number of tons going upwards from tide-water, in 1843, was as follows viz. :—

CLEARED AT	Merchandise.	Furniture.	Other Articles.	TOTAL.
	tons.	tons.	tons.	tons.
Albany.....	46,440	1888	9,581	57,909
West Troy.....	66,841	1089	16,735	84,665
Schenectady.....	405	253	363	1,021
Total	113,686	3230	26,679	143,595

The number of tons coming to tide-water, in 1843, is as follows, viz. :—

ARRIVED AT	Erie Canal.	Champlain Canal.	TOTAL.
	tons.	tons.	tons.
Albany.....	363,580	77,453	441,033
West Troy	269,187	124,083	393,270
Waterford	...	2,558	2,558
	632,767	204,094	836,861
Add the number of tons going from tide-water			143,995
Total number of tons ascending and descending			980,456

One hundred and eighty-seven tons came over the railroad from Schenectady, which is not included in the above.

There is an increase of merchandise going up the canals, of 19,473 tons, and an increase in the quantity of other articles of 828 tons ; making a total increase in the ascending quantity, comparing 1842 with 1843, of 20,301 tons.

The tons coming to tide-water have increased 170,235, comparing 1843 with 1842.

The merchandise cleared at Albany, West Troy, and Schenectady, in 1843 (113,686 tons), was left on the several canals in the following proportions, viz :—

C A N A L S.	Tons.	C A N A L S.	Tons.

Other articles		27,282
	34,632	447,069
		34,632
Increase		412,437

In all reports heretofore made by the canal commissioners, showing the tonnage arriving at tide-water in each year, the Champlain canal has never been separated from the Erie canal, so as to show the character and quantity of tonnage coming from each canal.

For the first time, the separation is now made; and the following statements show under general heads, the description and number of tons delivered at West Troy and Albany, in the last nine years, from each canal:—

STATEMENT, showing the Tons of each class of Articles delivered at Albany, from 1835 to 1843, both years inclusive, and coming from the Champlain canal.

Other articles.....	5 37	6 55	6 16
Total.....	100 00	100 00	100 00

A reference to the foregoing statements shows that the produce of the forest diminishes, on the average, on both canals; though, on the Erie canal, the tonnage of the forest delivered at tide-water, does not diminish as fast as the tonnage of agriculture from the western states increases.

The Champlain canal is sixty-six miles long, and with Lake Champlain, which is about 150 miles in length, opens an internal navigation of 216 miles. This communication is through a grazing, rather than a grain country. The forests of which, contiguous to the navigable waters, are rapidly disappearing. The agricultural surplus will not materially, if at all, increase; for the largest surplus of agriculture always comes from a comparatively new country, and decreases with the increase of population. The tonnage of the forest will not, of course, increase; for it is plain that in every locality the supply is in an inverse ratio to the demand. Population multiplies, but trees cut down do not soon renew themselves.

That portion of the Erie canal over which the largest volume of tonnage passes, and which, of course, requires the largest capacity, is between Utica and the Hudson river. It is over this portion of the canal that most of the tonnage moves which reaches tide-water.

The course of the lockages between Utica and Albany is furnished by the lockages at Alexander's lock, the first lock west of Schenectady, and which passes more boats than any other lock on the Erie canal. The lockages in the last nine years have been as follows:—

Y E A R S.	Lockages.	Y E A R S.	Lockages.
	number.		number.
1835.....	25,798	1840.....	26,687
1836.....	25,516	1841.....	30,320
1837.....	21,055	1842.....	22,869
1838.....	25,962	1843.....	23,184
1839.....	24,234		

The average of the up tonnage, for the preceding nine years, is, to the down tonnage, about as 1 to 5. As the up tonnage is merchandise, mainly, and the down tonnage is principally the product of the forest and of agriculture, it is not probable that the former will ever equal the latter.

That portion of the Erie canal over which the largest number of boats pass, is also between Utica and Albany. The number of boats which arrived at and departed from Albany and West Troy, during the last eleven years, was as follows :—

Y E A R S.	Boats.	Y E A R S.	Boats.
	number.		number.
1833.....	31,460	1839.....	31,882
1834.....	32,438	1840.....	36,456
1835.....	36,600	1841.....	33,782
1836.....	34,190	1842.....	32,840
1837.....	31,082	1843.....	32,826
1838.....	32,120		

Owing to the internal demand of this state for bread-stuffs, consequent upon the increase of population, it is not probable that the delivery, at tide-water, of the surplus of wheat and flour, the growth of this state, will much, if any, exceed that of past years. The increased delivery at tide-water, for the last eight years, has been, and that of future years probably will be, wholly of the growth of western states. And this increased delivery, it should be borne in mind, is not to be proportioned to the capacity of those states to produce, but to the demand for consumption at tide-water, on the Hudson river. This lengthened transportation of the products of agriculture, which pay nearly half the tolls, will thus increase the revenue much beyond the relative increase of the tons arriving at tide-water.

That the increase of delivery of flour and wheat, at tide-water, is the product of western states, is evidenced by the following statement :—

TONS of Flour and Wheat.

Y E A R S.	FIRST CLEARED.			Arriving at Tide-water.

The following table is given as the result of the canal commissioners' statement. The tolls of the Erie canal, for the last ten years, have been paid as follows:—

TOLLS on Agricultural and other Products.

Y E A R S.	From other States.	From this State.	TOTAL.	On Merchandise.	Total tolls on Erie Canal.
	dollars.	dollars.	dollars.	dollars.	dollars.
1834.....	105,204	686,824	802,028	378,940	1,180,968
1835.....	122,513	743,112	865,625	511,048	1,376,673
1836.....	182,328	709,617	890,945	549,595	1,440,540
1837.....	148,204	587,125	735,419	408,751	1,144,170
1838.....	234,020	640,451	874,471	539,703	1,414,174
1839.....	294,088	583,358	877,446	549,586	1,427,032
1840.....	433,222	681,602	1,114,824	482,510	1,597,334
1841.....	499,051	704,674	1,203,725	609,926	1,813,651
1842.....	496,666	618,713	1,115,389	453,568	1,568,947
1843.....	604,319	709,853	1,314,172	566,143	1,880,315
Totals for 10 years.....	3,119,705	6,674,329	9,794,044	5,049,770	14,843,804
„ first 5 years.....	792,359	3,376,129	4,168,488	2,388,037	6,556,525
„ second 5 years.....	2,327,346	3,298,200	5,625,556	2,661,733	8,287,279

From the above, it appears that the increase in the last five years is.....	dollars.	dollars.
That the increase on merchandise is	273,896	1,730,754
That the increase on products from western states is	1,534,987	
Showing a total increase of.....	1,808,683	
And that there is a decrease on the products of this state of	77,929	1,730,554

It will be understood that these are results of the Erie canal alone, distinct from any other canals.

The increase at Oswego is known to be mostly, if not wholly, on products from western states.

The increase at Oswego, is	dollars.
The increase on all the lateral canals, including Oswego, is.....	104,143
Thus showing a decrease of.....	43,621
in the last five years in the tolls of the lateral canals, on the "products of this state."	60,522

The results of the foregoing statements, for all the canals, is then as follows:—

Increase on the Erie canal.....	dollars.	dollars.	Decrease on products from this state:—	dollars.	dollars.
„ all other canals.....	1,730,754		On the Erie canal.....	77,929	
Total.....	43,621		On all other canals.....	60,522	
Increase on products from western states, viz:—	1,774,375		Total.....	138,451	
By way of Buffalo and Black Rock....		1,534,987	Leaving a balance of increase on agricultural products, from western states, of, ...		1,500,679
„ Oswego		104,143	Increase on merchandise sent from tide-water.....		273,696
Total.....		1,639,130	Total.....		1,774,375

These results show one of two things—either that the agriculture of this state

suffers from a competition with the cheap and fertile lands of the western states, which seek through the Erie canal a market for their surplus productions ; or that, as a country penetrated by canals becomes more densely populated, an internal demand grows up for productions which, at an earlier period, were sent to the sea-board. Both propositions may be, and to a certain extent, probably are, true. From the facilities of transportation, the states around the lakes, with lands to be procured at from two to ten dollars per acre, must continue to compete with the lands of New York, until they shall approximate nearly to an equality in value.

Number of Canal Boats.—It has always been a matter of uncertainty how many canal boats were in existence at any one period. The register of boats kept in this department shows some 5000 boats. A conviction that this was much beyond the actual number of boats, led to procure an accurate list.

The number, character, and tonnage of the boats, as shown by the table, are as follows. A column of value has been given, as obtained from an intelligent forwarder :—

DESCRIPTION OF BOATS.	Boats.	Average Tonnage.	Total Tonnage.	Value.
	number.	tons.	tons.	dollars.
Packets	40	34	1,370	40,000
Line boats	389	54	21,082	389,000
Lake ditto.....	379	63	23,865	379,000
Bull-head ditto.....	118	62	7,350	118,000
Scow-boats, decked.....	327	56	18,425	600,000
Ditto, not decked.....	873	52	45,361	
Total.....	2126	55	117,453	1,526,000

Among the reasons for the falling off of the passenger business on the Erie canal, is the continuous line of railroad from Albany to Buffalo. This has changed the construction of boats from the “line-boat” form, which has accommodations for passengers, to the “scow,” the “lake,” and the “bull-head” form which carry only freight.

The total miles run in each year by all boats, was as follows :—

Y E A R S.	Packets.	Freight Boats.	Total Miles.
	number.	number.	number.
1837.....	405,050	5,556,950	5,972,000
1838.....	400,250	6,126,800	6,527,050
1839.....	290,900	5,785,850	6,076,750
1840.....	258,850	5,053,300	6,212,150
1841.....	322,860	7,103,550	7,426,410
1842.....	354,300	6,173,200	6,527,500
The annual average of the last three years, is.....			6,722,030
“ first “			6,191,933
Increase.....			530,097
Or equal to an increase of 276-100 per cent per annum.

The valuations are those of the prices in Albany, at the time of their arrival.

CHAPTER XVII.

COMMERCE OF THE AMERICAN LAKES.

BEFORE the conquest of Canada in 1759, the commerce of the lakes was carried on merely on account of the fur trade, and although settlements extended thinly and gradually along their banks after the American revolution, yet the supplying the fur traders with provisions and other articles, and the settlers with necessary goods and implements, and bringing down either to Montreal or New York, furs and such other produce as was collected, constituted the trade until 1830-32. This was especially the state of the trade north and west of Detroit.

In 1819, a steamboat, called *Walk-in-the-Water*, appeared on Lake Erie, made a trip as far as Mackinaw, or Machittinack, to carry up the American Fur Company's goods, and annually repeated the same voyage until she was wrecked near Buffalo, in November, 1821. Her place was then supplied by the steamboat *Superior* (now the *ship Superior*), in 1822. This boat made similar voyages to Mackinaw.

In 1826 and 1827, a steamboat made an excursion with a party of pleasure to Green bay, Lake Michigan. These pleasure excursions were annually made by two or three boats until the year 1832, when the government required the transportation of troops and supplies for the Black Hawk Indian war, and steamboats

were chartered by the government, and proceeded to Chicago, then an open roadstead, exposed to northerly storms, for the whole length of Lake Michigan.

In 1833, there were employed eleven steamboats, which carried to and from Buffalo and other ports on the lakes, during the open season, 61,485 passengers, from whom and for freight the projectors received the sum of 229,212 dollars 69 cents as an offset against the cost of about 300,000 dollars for the steamers.

Of the passengers carried, 42,956 were taken from Buffalo, bound west; the remaining 18,529 passengers were all landed at Buffalo, and distributed at the different ports along the lake.

Three trips were made to the upper lakes, two to Chicago, and one to Green bay; one of the boats left Buffalo on the 23rd of June, at 9 P. M., and returned on the 18th day of July, at 10 P. M. The other left Buffalo the 20th day of July, at 4 P. M., and returned August the 11th.

In 1834, the association was continued, and was composed of eighteen steamboats, which plied on the lake.

In 1836, the steamboat association formed in 1833, was dissolved; the number of steamboats increased, as did the business.

But from a general suspension of specie payments by the banks occurring in May, 1837, a less number, or at least no greater number, of passengers crossed the lakes in either 1837 or 1838, than in 1836; and a great decrease of goods going west, also had a tendency to diminish the business of those years.

In 1839, the owners of steamboats finding the number of boats, and the amount of capital employed in the business, so much greater than the trade could maintain, formed a new association, by which part of the boats were run, and a part laid up.

A regular line of eight boats was formed to run from Buffalo to Chicago, making a trip to Detroit every sixteen days. Emigrants, with their household furniture and farming implements, and others going west, gave these steamboats employment.

In 1840, this steamboat association employed more boats than that of 1839. This year the number of boats on Lake Erie was forty-eight, of various sizes, from 150 to 750 tons' burden, and cost in their construction about 2,200,000 dollars; a part of these boats were run, and a part laid up. The aggregate earnings of the running boats, for passengers and freight carried both ways, amounted to about the sum of 725,523 dollars 44 cents; this amount includes the earnings (estimated) of several boats that did not belong to the association, and added to the amount earned by the associated boats. Eight boats ran regularly this season from Buffalo to Chicago, making sixteen day trips, and one for a time from Mackinaw to Green bay, and occasionally to the Sault Ste. Marie; the aggregate earnings of which amounted to 302,757 dollars 93 cents. Two-thirds of this may be properly considered as business west of Detroit, and is 201,838 dollars 62 cents.

These receipts (with the exception of 12,000 or 14,000 dollars paid by government for the transport of troops) were paid by passengers and freight of merchandise to the different towns on the borders of Lake Michigan, and passengers and produce brought down.

In 1841, the same arrangement was made, and included nearly all the steamboat interest on the lakes. The boats were run in the same manner as in 1840, with this exception, that six boats of the largest class ran from Buffalo to Chicago, making fifteen day trips, and one to Green bay a part of the season, making a trip in fourteen days. These boats have made during this season 525 trips from Buffalo, of which 444 were made on Lake Erie to Toledo, Perrysburgh, River Raisin, and Detroit; and eighty-one to the upper lakes, of which seventy were made to Chicago, and the other eleven to Green bay and the Sault Ste. Marie—and to make these trips, have run between 440,000 and 450,000 miles. In addition to which, a small boat has run daily during the season, from Buffalo to Dunkirk and Barcelona, and occasionally to Erie.

From the increased quantities of agricultural products brought down from the shores of Lake Michigan in 1841, and many tons of lead and shot from the mines in that section of country, now for the first time in any considerable quantity, find a market by Lake Erie; and the great increase of travellers from New Orleans to the northern states, during the hot season of the summer months, having selected this route in consequence of its being more speedy, less expensive, more healthy than the lower route, and affording the traveller a view of the magnificent scenery of the islands and shores of the great lakes; it is estimated that three-fourths of the business done by the Chicago and Green bay boats, in 1841, was carried on by commercial enterprise west of Detroit.

So far as steamboats are concerned, owing to the entire want of safe harbours around Lake Michigan to afford them protection, their whole business is now confined to the western shore of that lake. During the late season, in mid-summer, two or three boats made each a trip to St. Joseph's and Michigan city. Milwaukee, Racine, Southport, and Chicago are the places where they have regularly done business.

STATEMENT showing the Number of Ships, Brigs, and Schooners, on Lakes Erie, Michigan, and Superior, together with their Amount of Tonnage and Value, in 1843.

VESSELS.	Number.	Tons.	Value.	To what Port belonging.
		number.	dollars.	
Ships	1	260	8,000	Cleveland.

Schooners and sloops	15	792	58,000	Sandusky.
Total ships, brigs, schooners, and sloops ..	225	17,988	658,400	
Total steamboats	61	17,324	1,741,200	

In alluding to the progress of the west, and of steam navigation, a Buffalo periodical of 1843, remarks :—

“The present month completes a quarter of a century since the first steamer was launched upon the western lakes. During that period changes of vast magnitude have been effected by the application of the mighty agent, steam. Dense forests, which frowned from the margin of great lakes, have been felled, to give place to thriving villages ; and the moody aboriginal occupant, who gazed with wonderment at the approach of the ponderous vehicle, has become extinct, or is known only as a wanderer beyond the limits of the Mississippi. Changes like these have characterised the introduction of steam upon the lakes ; and the independent, inquiring spirit, which so distinctly marks the habits of the people of this country, has kept pace with the progress of steam westwardly, and developed the fertility and abounding resources of the prairies, until they have become the granary of the world.

“Of those who early participated in the effort to build up this new commerce, but few remain; still, they have vivid recollections of the undertaking, attended as it was by a heavy outlay and much solicitude for its consummation. To them, if not to those now actively engaged in its prosecution, a list of steamers down to the present season must be interesting ; and we have, at no inconsiderable time and trouble, been enabled to make up the table below. Should such be the case, those at the west who have records as authority will make corrections, and call attention in some suitable manner, as we are desirous to obtain such information. The list of steamboats, constructed from the first attempt to navigate Lake Erie by steam, with place and date of building, together with their tonnage, is as follows :—

" Besides the above list, there are a few small boats of which nothing is known other than their names. Among those are the Pantanguishane, Cynthia, Pontiac, and Phenomenon, making, with those above given, an aggregate of 27,000 tons, at a total cost of 3,510,000 dollars; 130 dollars a ton being what we deem true data for building and fitting out this description of vessels.

" In examining the progress of steam, as applied in propelling vessels on the lakes, we are struck with the very small number of disasters when compared with other sections of the country, especially in the western waters. In the whole period of twenty-five years, there have been but four explosions which might be termed serious. It is true, there are other disasters to record, whose calamitous details are too freshly impressed upon the public mind. The following tabular view presents both these classes :—

EXPLOSIONS.	Lives lost. number.	BURNED.	Lives lost. number.
Peacock, September, 1830.....	15	Washington, June, 1838.....	50
Adelaide, June, 1830.....	3	Erie, August, 1841.....	250
Erie, August, 1840.....	6	Vermilion, November, 1842.....	5
Perry, twice in 1835.....	6	Caroline (wilful).....	5
Total.....	30	Total.....	310

" The incidental disasters, such as collisions, wrecks, &c., are as follows :—Walk-in-the-Water, wrecked in a gale in our offing, November 1, 1821—total loss. Washington (1st), wrecked in a gale, near Long point, in 1833, and one man drowned. She was a splendid new boat, cost 60,000 dollars, and the first season out—totally lost. Delaware, wrecked in a gale, near Chicago, in 1834—totally lost. Crockett, wrecked in a gale, near St. Joseph, in 1834—totally lost. Detroit, ashore near Southport, on Lake Michigan, in 1836—totally lost. Adelaide, ashore in a gale, on Lake Michigan, in 1840—totally lost. Taylor, wrecked, at Michigan city, in 1838—totally lost. The Taylor took fire near the mouth of Cattaraugus creek, in the autumn of 1836, but the flames were subdued in time to save the boat. One hand jumped overboard, and was drowned. Don Quixotte, lost in a gale, on Lake Huron, in 1836. Thames, burned by the 'Patriots,' at Windsor, in 1838. Webster, burned to the water's edge while lying up in Buffalo, in 1835. The Great Western was burned, at anchor, in Detroit, in 1839. The Cynthia, a Canadian ferry-boat, was burned, near Malden, in October, 1838. Minnesetunk, sunk by collision with the Erie, near Detroit. She has since been raised, enlarged, and is now known as the Godrich. Little Western, burned at Detroit last season. Macomb, ashore in a gale at the mouth of Detroit river last fall. Niagara, by collision with some other boat, at Huron. Ohio, sunk, at Toledo, in 1837. Little Erie, totally lost in the ice last fall, near Detroit. The Sandusky, consumed by fire while lying up in our harbour, last February.

" Of the old boats which have gradually gone to decay, we note the following :—Chippewa, Henry Clay, Enterprise, and Pioneer, in this harbour; Peacock and Pennsylvania, at Erie; Marcy and Brady, at Detroit; Thompson, at Huron; Newberry, at Miami city; Perseverance, at Monroe; Uncle Sam, at Charlestown; with some of the smaller boats, whose whereabouts are not distinctly known. Many of the larger class of boats, seldom used of late, are laid up in ordinary at the places named :—Webster, Townsend, New York, Star, and Monroe, at this port; Jefferson, at Erie; United States, at Cleveland; Michigan, at Detroit; Milwaukee, at Milwaukee. The Porter is now known as the Toronto, in the service of the Canadian authorities; the Minos is the armed steamer, also in the same employ. The Superior was long since dismantled, and converted into a ship, and is the only vessel of that description now on the lakes; the Julia Palmer having been converted into a steamer, and the Milwaukee lost in the disastrous gale of November last, upon Lake Michigan. The Cincinnati, Jack Downing, Barcelona, and Mazeppa, have also been converted into sail craft. The latter is known as the schooner, General Scott. The St. Clair was originally known as the Saginaw, Rhode Island, &c., of only 160 tons. During the past winter, she was remodelled and enlarged at Detroit, and now rates 250 tons. The Wisconsin was originally 490 tons, but is now being lengthened sixty feet, which will add to her tonnage at least enough to meet the figure given in the table.

" The Caroline, whose destruction filled so large a portion of public notice, was originally known as the Carolina, and believed to have been built at Charleston, South Carolina, at a very early date, as she was rebuilt at Ogdensburg, as given in the table. She was very strongly built, of Norway pine, and copper fastened. After passing down the St. Lawrence, she ran a couple of seasons on the Hudson, when her guards were shipped, so as to admit her through the Erie canal to this city. The date of her destruction is at Schlosser, Niagara county, New York, December 29, 1837.

" The number of boats yet remaining of the whole once in commission on Lake Erie and the other upper lakes, is about sixty, with an aggregate of 17,000 tons. Of these, some thirty-five only are used when the Consolidation is in existence.

"Of the whole number of boats put in commission during the above period, only *ten* were built and owned in Canada.

"The first steamer known to be upon Lake Michigan was the *Henry Clay*. In August, 1827, an excursion of pleasure was made in her to Green bay, where Governor Cass was holding a treaty with the Winnebagoes. After the treaty was concluded, the governor and suite returned in the *Henry Clay*. From that period to 1832, some of the boats went to Green bay, but no farther. On the breaking out of the Black Hawk war, several of the larger boats were chartered by government to convey troops to the disaffected territory; and Chicago, for the first time, was greeted by the sight of one of those strange visitors.

"The building of the propeller *Hercules* is the commencement of a new era in lake navigation, and her owners predict for that description of vessels a large share of the carrying trade, especially upon the upper lakes. The *Hercules* is 275 tons' burden, 135 feet long, twenty-five feet beam, eight feet hold, and put together in the strongest manner. She has fourteen state-rooms, six feet square, with sufficient additional space for the erection of forty-six berths more; and, from the peculiar symmetry of the vessel, she will doubtless afford ample accommodations for families emigrating. Her space below, for storage, is large, having almost the entire hull of the vessel appropriated for that purpose. The peculiar feature, however, of the *Hercules* is her engine and its auxiliaries. On examining the machinery, all are struck with the infinite compactness of the steam apparatus and its perfect simplicity, the whole weighing but fifteen tons. The engine is simple and very small, lies close upon the keelson, and fills but a space of six feet square. It is one of Ericson's patent, was made at Auburn, and is computed to be of fifty horse power. We might here remark, that the weight of an engine and boilers for one of our largest steamers is estimated at from sixty to ninety tons, the dead weight of which a propeller escapes carrying. The paddles are made of boiler iron, three-eighths of an inch thick, eighteen inches broad, by thirty inches long, and are placed on two long wrought-iron shafts, protruding from either side of the stern-post. The diameter of the paddles is six feet four inches. From the superb manner in which the *Hercules* is built and fitted out, having cost nearly 20,000 dollars, it is apparent that the Messrs. Hollisters are determined to give the experiment a full and fair trial. Another boat, of the same tonnage, for the same owners, is now being built at Perrysburg, and will be out next month. The Cleveland propeller was launched on the 22nd ult., and the fourth vessel of the kind is rapidly progressing toward completion at Chicago.

"Ten cords of wood, at a cost of seventeen dollars, will suffice the propeller per diem; while one of our largest steamers will consume two cords per hour, at a cost of eighty dollars a day. Some of the steamers even exceed this calculation by thirty-three per cent.

"The aggregate and importance of our lake trade is thus spoken of in a report made during the past season by the committee on commerce to Congress:— 'It appears, that in 1841, there were upon Lake Erie and the upper lakes more than fifty steamers, constructed at a cost of between 2,000,000 and 3,000,000 of dollars; and, among them, some (varying from 600 to 800 tons) which, for strength, sea-worthiness, beauty of model, and elegance of finish, may compare advantageously with any in America; and, notwithstanding the exceeding and continued pecuniary pressure of that year, that their aggregate earnings for freight and for passengers, during the season of navigation, and after accomplishing voyages, amounting collectively, by estimation, to near 450,000 miles, were 767,132 dollars. During the same year, the probable amount of capital invested in *sail vessels*, on the same lakes, was estimated at 1,250,000 dollars, and *their* earnings, during the same season, are estimated at 750,000 dollars. If to these earnings there are to be added 150,000 dollars for freight and toll upon United States products, passed during the same year through the Welland canal, it will be seen that the product of the navigation and commercial business upon these lakes amounts annually to the large sum of 1,700,000 dollars; while, at the same time, it has been productive of the vast advantage of furnishing employment and support to great numbers of sailors, and others connected, of necessity, with the business.

"From the reports of the Topographical Bureau, and other documents, which the committee had access to, it further appears, that during the year 1840, the number of entries and departures of vessels and steamers at Buffalo was 4061; that, during the same year, the number was equally great at Cleveland; and that, of the 2,000,000 bushels of wheat shipped, 896,550 bushels were cleared from that port for Canada or the Welland canal; and that there were, during the same period, and from the same place, 422 clearances of vessels for Canada or the Welland canal. It further appears, by those documents, that dutiable merchandise from New York or elsewhere, to the value of 10,000,000 dollars, was discharged at Cleveland, and destined for the Ohio and Mississippi valleys, passing down the Ohio canal, and for consumption and supply in the state of Ohio.

"The rapidity with which the navigation and commerce of the lakes has thus grown up, constitutes a striking feature in the general subject. With that is connected a consideration of the influence produced upon those interests by the completion of the great lines of communication between the Hudson and Buffalo, by canal and railway; and between the Ohio river, at the mouth

of the Scioto and Lake Erie, at Cleveland, through the Ohio canal. This influence is ably and sufficiently illustrated in the different expositions contained in the reports of the Topographical Bureau; and, if consequences so vast may justly be deduced from the opening of those lines of communication, who can measure the extent of that teeming commerce which will be poured into Lake Michigan, through the canal up the Illinois? and how immeasurably will that commerce be swollen and expanded by the completion, now so nearly accomplished, of the Ohio and Indiana canal, of the Miami and the Wabash, which terminates in the Miami bay, and of that canal which is to unite Pittsburg with the lakes at Erie, and of all those other lines of communication by railroad which are respectively in a course of completion?

“Of the actual condition of the commerce of the lakes, some adequate conception, it is believed, can be formed. The secretary of war estimates its annual value at a sum exceeding 25,000,000 dollars.”

“In size, model, speed, finish, and general arrangement, these vessels are unsurpassed. The original cost of these vessels varies from 15,000 dollars to 120,000 dollars each. A boat of the largest class requires the services of forty men to manage her, whose salaries are as follows:—

C R E W.	Per Month.	C R E W.	Per Month.
	dollars.		dollars.
Captain	100	First mate	60
Clerk	45	Second mate	30
Steward	45	Chief cook	20
Nine deck hands, each	14	Two assistants, each	20
Eight firemen	20	One female ditto	14
Four wheelmen	25	Four waiters, each	12
One engineer	60	Two porters	12
Two assistants, each	30	One carpenter	20

Or, at the farthest, 1000 dollars for labour.

“During this period, a steamboat will make four trips to Detroit and back to Buffalo, and consume about 1000 cords of wood at each trip, at a cost of about one dollar eighty-five cents per cord. She will also consume about thirty-three gallons of oil each trip, with an outlay of ten dollars for washing, besides other trifling contingencies.

“Attached to the lake consolidation there are thirty-seven boats, comprising the whole of the large class now afloat on Lake Erie. Between high and low pressure boats there are vast differences in the cost of outfit. The Missouri (high pressure), large class, 610 tons, cost when ready for service, 80,000 dollars. Her engine, horizontal, and one of the most perfect ever put into the hull of a vessel, was purchased at a bargain, and cost at Pittsburg, in June last, 18,000 dollars. An additional 3000 dollars more was paid for its transportation to Erie. Her upholsterer's bill amounted to 4000 dollars. The Cleveland, low pressure, large class, 570 tons, was built and fitted out three years ago, at a time when labour and materials were very high. Her hull cost 22,500 dollars, engine 45,000 dollars, with an additional 5000 dollars for shafts, &c., furnished at Buffalo previous to her going into service. This craft is allowed to have the most happy combination of arrangements of any boat on the western waters, a circumstance most assuredly which gives her such great speed. She consumes three cords of wood every hour, or 150 to Detroit and back to Buffalo, and 600 cords to Chicago. An ordinary high pressure boat will consume about eighty cords to Detroit and back, or 375 to Chicago and back. During the first twelve trips of the Constitution this season to Detroit and back, she consumed 1130 cords of wood, at a cost of one dollar seventy-five cents per cord, amounting to within a fraction of 2000 dollars for fuel.

“When running, the rate of insurance is six or seven per cent, and when lying up, during the winter, only one per cent is charged. Sometimes, however, in very boisterous weather, near the close of the navigation, two per cent a month is charged for policies. These policies are rarely taken out by heavy owners; it is done mostly by persons not engaged in the forwarding business, who own a few shares of stock, and are solicitous for its safety. The great bulk of steamboat stock is uninsured. One of the most prominent features which characterise our lake craft is the elegant style in which they are painted. This is a feature belonging exclusively to Lake Erie. Every traveller that has passed between Buffalo and points west, will acknowledge and award to the artists of Buffalo high commendation for the manner in which they have performed their labour. Four thousand dollars has been paid for the painting, glazing, and ornamenting a single steamboat.

“*Steamboats on Lake Ontario.*—The following lists of steam vessels employed in the navigation of Lake Ontario and the St. Lawrence, include all that have been so employed, from the first use of steam on those waters, and whether built on the United States or the Canadian side. We are indebted for the statement to Mr. John Disturnell. The amount of tonnage propelled by steam, on the Canada side, will be seen to be not far from four times more than the amount belonging to the American side; a difference which though in part accounted for, by the great extent of waters exclusively Canadian, is still, notwithstanding this fact, a greater difference than would, we apprehend, have been generally supposed to exist.

“*Daily line of steamers.*—A numerous meeting, called by his worship the mayor, was held

recently at the Albion Hotel, on the subject of forming a Joint Stock company, with a capital of 20,000*l.*, to run a daily line of steamers between Quebec and Montreal. Several resolutions were passed to that effect, and a committee of twenty-five appointed to solicit subscriptions to the stock. Mr. J. Ryan showed a list of persons who had already subscribed to the amount of upwards of 5000*l.*—*Quebec Gazette.*

“*Proposed steamboat between Toronto and Goderich.*—The estimates of a steamboat to be worked by a propeller, in order that it may pass the Welland canal, have been brought to our notice by a correspondent. It is proposed to build a steamer at St. Catherine's, which would cost 4600*l.*, to ply between Toronto and Goderich. It is expected that such a vessel will make twelve trips during the season, carrying 2500 barrels of flour, 100 tons of merchandise, and sixty passengers, and that this will produce a clear profit, after all expenses are paid, of 3000*l.*, or above fifty per cent, after all allowances are made for contingencies.

“Various individuals are mentioned as willing to take shares. The people of Goderich are said to be willing to take 2000*l.* of it, and the Canada Land company pays fifty dollars to an American boat as a premium every time it touches Goderich, which they would prefer paying to a Canadian. We are unacquainted with the grounds on which these calculations have been made, but would recommend the parties who have made them to come openly forward with their names, and lay the plan regularly before the public, if they cannot have sufficient subscriptions privately. One thing is certain, that Toronto and Goderich, the terminations of the proposed line, would derive material benefit from such a new medium of intercourse, as well as every place on the line where it might be deemed expedient to touch.”—*Toronto Globe.*

“The following is a list of American steamboats, built and running on Lake Ontario, since their first introduction in 1816. Those marked * are broken up :

List of American Steamboats, built and running on Lake Ontario.

When built.	Names.	Tons.	Where built.
1816.....	Ontario*.....	400	Sackett's harbour.
1818.....	Sophia*.....	75	Ditto.
1820.....	Martha Ogden* ..	150	Ditto.
1830.....	Brownville*.....	150	Brownville.
1851.....	Charles Carrol* ..	100	Sackett's harbour.
1831.....	Paul Pry*.....	50	Ogdensburg.
1832.....	United States.....	150	Ditto.
1833.....	Black Hawk.....	200	French Creek.

1840.....	Albion.....	200	Brockville.
1840.....	America.....	300	Niagara.
1840.....	City of Toronto.....	500	Ditto.
1840.....	Sovereign.....	475	Ditto.
1841.....	Princess Royal.....	500	Ditto.
1841.....	Canada.....	450	Prescott.
1841.....	Frontenac.....	200	Kingston.
1841.....	Sir Charles.....	200	Ditto.
1842.....	Prince of Wales.....	200	Ditto.
1842.....	Admiral.....	400	Niagara.
1842.....	C. Just. Robinson.....	400	Ditto.
1843.....	Eclipse.....	400	Ditto.
	Total tons.....	12,600	

† Lost in 1842.

‡ Destroyed by the Patriots in 1839.

“In addition to the above list of British steamboats, of a large class, there are a number of smaller boats and Ericson Propellers, running from Kingston to Montreal, passing down the rapids of the St. Lawrence river, and returning through the Rideau canal, carrying an immense amount of produce, merchandise, and passengers. When the Beauharnois canal is completed, vessels of a large class can run direct from Montreal to the Upper Lakes.

MISCELLANEOUS STATEMENTS OF THE COMMERCE AND NAVIGATION OF THE
AMERICAN TOWNS ON THE LAKES.

The present trade of the inland seas of America, according to a statement in the *Buffalo Advertiser*, is but a fraction, if any, short of being *four times* the amount of the export and import trade in 1775, of the 3,000,000 inhabitants then living in the thirteen revolted colonies.

According to Pitkin, the foreign trade of those colonies for the six years preceding 1775 was on an average:—

Exports	£ 1,752,142	dollars. 7,779,510
Imports	2,732,036	12,130,239
Total.....	4,484,178	19,909,749

The official records at Washington, as recently stated by Colonel J. J. Abert, of the United States Bureau of Topographical Engineers, show that the trade of our great lakes, was, in 1841—

Exports.....	dollars. 32,342,581
Imports.....	33,483,441
Total.....	65,826,022

Notwithstanding the *over* trading which marked the year 1836, the aggregate of the export and import trade on the lakes that year was only 16,416,354 dollars. Subtract the latter from the amount of the lake trade of 1841, and the difference will be 49,364,668 dollars—an increase of *fifty millions* in five years! By this ratio, the commerce of the lakes during the present year should exceed 85,000,000 dollars.

In 1819, there was but one steamboat on the lakes.

In 1827, the waters of Lake Michigan were first ploughed by steam—a boat having made an excursion to Green bay.

In 1832, a boat reached Chicago with troops.

In 1833, there were eleven boats on the lakes, which cost 360,000 dollars, and carried that year 61,480 passengers; and with the freight the receipts were 229,212 dollars 69 cents. This season three trips were made to Chicago, and one to Green bay; the amount of receipts was 4335 dollars 39 cents. The time of running from Buffalo and returning averaged twenty-two days.

In 1834, seven new boats came out, which made eighteen in service for the year. Total cost, 500,000 dollars. The amount of the earnings of the boats this year was 238,565 dollars 95 cents. Two trips were made to Green bay, and three to Chicago; and the amount received for them was 6273 dollars 65 cents.

In 1839, the increase of business to Chicago in Lake Michigan, and ports west of Detroit, was so great that a regular line of eight boats ran from Buffalo to Chicago, making a trip in sixteen days.

In 1840, the number of boats on the lakes increased to forty-eight, and the cost

of them was 2,200,000 dollars. The earnings of the boats was 725,523 dollars 44 cents. Rising of 200,000 dollars of this amount was earnings west of Detroit.

In 1841, 525 trips were made from Buffalo to Detroit; eighty-one to the upper lakes, of which seventy were to Chicago, and ten to Green bay. Earnings of all the boats, 767,123 dollars 27 cents. The upper lake boats contributed 301,803 dollars 39 cents to this amount. In 1841, the number of sail vessels was estimated at 550, varying in size from thirty to 350 tons, and the cost of them 1,250,000 dollars, and their earnings at 750,000 dollars. The earnings of British vessels on the lakes is estimated at 150,000 dollars. The earnings of the steamboats and sailing vessels on the lakes in 1841, from the best data we can get at, is—

American steamboats.....	dollars. cts.
" sailing vessels.....	767,123 27
British vessels, generally.....	750,000 00
	150,000 00
Total.....	1,667,132 27

Lake Tonnage.—According to the secretary of the treasury's report, the enrolled and licensed tonnage in 1841, at the various districts on the lakes, was—

Sackett's Harbour.....	tons.	Brought forward.....	tons.
Oswego.....	3,623	Sandusky.....	25,909
Niagara.....	8,346	Detroit.....	2,642
Buffalo.....	230	Mackinaw.....	11,433
Cleveland.....	4,196		470
	9,514	Total.....	40,454
Carried forward.....	25,909		

The district of Detroit excels any other—Cleveland next.

"The large imports of merchandise, in some former years, were concomitant with extended bank loans—a means by which the credits were unduly sustained, and sales of goods prolonged in excess of the means of payment. This took place during that season of speculation which pervaded all sections of the union, and was a necessary consequence of that ill-judged multiplication of banks created to supply a supposed want, induced by the anticipated expiration of the charter of the late national bank."—*Hunt's Magazine*.

“The quantity of merchandise imported into Ohio, in 1844, was sixty per cent of the quantity imported in 1839, when the loans of the banks had been running near their highest points. At the same time, the exports of produce have largely increased. The value of the imported merchandise is officially estimated at 300 dollars per 1000 lbs. ; consequently, the import of 1839, was worth 10,462,500 dollars, and that of 1844, 6,252,800 dollars ; a reduction of 4,210,200 dollars. At the same time, an increase of exports took place, calculating the quantities at present prices, as follows :—

ARTICLES.	Quantity.	Value.
		dollars.
Wool.....lbs.	896,692	448,346
Pork.....barrels	42,000	420,000
Lard.....lbs.	6,046,338	420,000
Coal.....bushels	405,424	202,712
Wheat.....do.	738,600	738,600
Total increase, five articles..		2,229,658

“This makes a difference of 6,439,856 dollars more, in the year’s business of 1844, in favour of Ohio, than that of 1839.

509 barrels of beans.....	1,200	911 barrels of plaster, ground.....	1,366
Carried forward.....	775,103	Total value.....	853,032

Besides these shipments, there were 132½ tons of sundries, of which no valuation was computed. Of imports, there were, in gross, 3812 tons of merchandise taken in store, intended for the traders of Sandusky, and for a wide extent of interior country. Also, 19,337 barrels of salt, for consumption in the packing establishments in the town, and for the supply of the country; besides lumber to a large amount, the quantity not known. This statement includes only the business of the town of Sandusky.

"There are upon Sandusky bay and its tributaries, three other points of business importance, to wit: Venice, situated three miles above Sandusky, at which the manufacturing of flour is largely carried on; Portage, situated twelve miles up the bay, near extensive beds of gypsum, which is manufactured by steam power, and annually shipped to the extent of several thousand barrels; and Lower Sandusky, situated at the head of navigation on the Sandusky river, thirty-six miles from the mouth of the bay. The latter town is the seat of justice of Sandusky county, enjoying a considerable hydraulic power, and trading with an extensive and growing portion of the country."—*Hunt's Magazine*.

IMPORTS AND EXPORTS OF SANDUSKY, HURON, AND MILAN.

A writer in *Hunt's Magazine* (1844), says:—

"I can predict, with safety, a very large increase of produce shipped from this port, after the completion of another railroad, now rapidly progressing (fifty-six miles long), terminating in the heart of the richest wheat-growing country in the state (Richland). This road cut off Milan from the best trade she is now enjoying. It will be completed in eighteen months."

STATEMENT of Exports from the Port of Sandusky, for the year 1843.

SHIPPING OWNED IN THE STATE OF MICHIGAN.

In 1819 the shipping owned in the territory was about 600 tons.

From 1830 to the present time, we find the following aggregate tonnage registered as belonging to the Detroit district :—

YEARS.	Tons.	YEARS.	Tons.
1830.....	995	1836.....	5,066
1831.....	1105	1837.....	6,994
1832.....	2740	1838.....	
1833.....	2575	1839.....	
1834.....	4009	1840.....	11,942

In 1817, there were imported into Detroit—

5501 barrels of flour.	888 barrels of pork.
1948 " whiskey.	693 firkins of butter.
295 " fish.	1042 head of beef cattle.
5062 bushels of corn.	1435 fat hogs.
2843 barrels of salt.	

There were exported the same year, to military stations on Lakes Huron and Michigan—

2024 barrels of flour.	1282 barrels of salt.
753 " cider.	105 " pork.
394 " beef.	457 " whiskey.
153 firkins of butter.	1280 bushels of corn.

1840	106,896 barrels.
1841	314,686 " "
1841	294,515 bushels wheat.

Pork.—In 1836, Michigan imported from Ohio, 34,000 barrels of pork, at an average price of twenty dollars per barrel. Total cost 680,000 dollars. In 1837, the census was taken, and the number of hogs, then in the state, was 109,096. The census of 1840 gave 342,920, being an increase in two years of 232,534, or about 100,000 a year. It is a fair estimate, that at the commencement of slaughtering in 1842, there were 700,000 *grunTERS* in the state.

LAKE SUPERIOR COPPER COMPANY.

The region bordering on Lake Superior abounds in various kinds of mineral wealth ; but it is only recently that any systematic efforts have been made to develop its hidden treasures. " A large tract of country," it is stated in the *Detroit Advertiser*, embracing the mineral district, was purchased by the government from the Indians, in 1842 ; and the government at once adopted the policy of granting leases to practical miners, of such portions as they should select for their mining operations. That tract, thus selected, is termed a location, and embraces three miles square, or nine square miles of land ; and the proprietor of the lease enjoys the exclusive possession of it for nine years, upon paying to the government six per cent of the mineral, by way of rent. The company above named was formed last winter, and the stock is owned by gentlemen in Boston, Washington, St. Louis, and Detroit. They have obtained leases for fifteen such locations, said to be well selected, and rich in copper ore, and are now actively engaged in prosecuting their business. Their head-quarters are at Eagle harbour, on Point Keweenaw. About twenty Cornish miners, under the superintendence of C. A. Gratiot, of Mineral point, are now digging the ore ; but the company do not intend commencing the smelting process until next spring. Mr. C. C. Douglas, late assistant to Dr. Houghton, has been engaged by the company as their geologist.—(*See Fisheries of America, for Fisheries of the Lakes.*)

A statement of the tons and different classes of property coming from other states, and shipped at Buffalo, Black Rock, and Oswego, during last nine years, is as follows :—

The commerce of the north-west, great as it is, and rapidly increasing, absorbs comparatively a small portion of the agricultural production of the entire west. The numerous states bordering the Mississippi, and which possess free channels of navigation to that river, pour a great proportion of their products down through that channel to New Orleans, whence they are shipped to the various parts of the world.—(See *New Orleans*.)

IMPORTS at the Port of Buffalo to the 1st of July, each Year.

Commerce of Oswego, 1840.—“ The registered tonnage of vessels owned at Oswego, in 1840, is 8346 tons, and the number of entrances and clearances of American vessels, being generally schooners of large class, is 1822. There were received at Oswego, during the past year, 764,657

bushels of wheat ; of which, 672,790 bushels have been manufactured at the Oswego mills, and the residue been exported to the north, or gone east by canal. There were manufactured there, in 1840, 145,000 barrels of flour, 35,000 of which were exported to Canada, and the residue sent down the canal, or consumed at home. Of salt, 205,000 barrels were received at that port by the Oswego canal, from the Onondaga works ; of which, 153,538 barrels were shipped to the upper lakes ; 42,000 barrels were exported to Canadian ports, on Lake Ontario and the river St. Lawrence ; and 14,544 barrels went to a domestic market, excepting a small quantity that remains on hand. A large quantity of agricultural and domestic products have been received there from the north ; among which, 7315 barrels of ashes, and nearly 4,000,000 lbs. of butter and cheese, have cleared for an eastern market by the canal. The tolls collected at the Oswego office for 1840 are 51,899 dollars twenty-three cents, to which the Oswego mills have contributed, in tolls on flour and ship stuffs, 21,943 dollars eleven cents, notwithstanding the large northern export of 35,477 barrels that went to market by the St. Lawrence. From the 1st of September to the close of the season, 100,000 barrels of flour were turned out at the Oswego mills, showing that they have ample power to manufacture 1,000,000 barrels during a season, if the market and profits would justify so large a business. 'On the whole,' says the *Herald*, 'our commercial men have done an active, and, we believe, profitable business, with tolerably good prospects a-head for an active trade in the spring. The country is full of produce, and contracts are making by purchasers and forwarders. A large number of first-class vessels, and several steamboats, are being built for the business of the ensuing season. Two fine vessels and a steamboat are building at Oswego, which will be ready for the spring trade. The American produce that went to the Montreal and Quebec markets, during the past season, amounts to two millions of dollars, and the 1400 sail of square-rigged vessels that cleared from those ports during the same period, furnish some evidence of the growing Canadian trade. Stimulated and encouraged by the success that has hitherto rewarded their enterprise, our neighbours across the lake are on the alert, preparing, with ample means and increased capital, to compete for the products of the western states, and to divert the current of trade down the St. Lawrence.' This occurred before the passing of the Canada Corn Bill."

TRADE BETWEEN THE COUNTRIES OF THE UNITED STATES, BORDERING THE LAKES AND THE CANADAS.

The increased trade of Canada is, to a great extent, owing to the intercourse either by legal or by contraband trade, with the United States. The resources and population of the Canadas alone are, however, sufficient for a very important amount of navigation and commerce.

The population of Lower Canada, by the census of 1844, amounted to 678,590. In 1831, the number was 511,919 ; increase, 166,671. The population of Upper Canada may be estimated, at the end of 1845, at 575,000, and of Lower Canada at 695,000 :—total, 1,270,000 inhabitants.

In nine years, the tolls on the Welland canal rose from 4300*l.* to 23,946*l.* ; and in three years the sums collected for tolls on the macadamised roads rose from 1638*l.* to 6829*l.* Great as is the commerce of the United States with England, the tonnage required to carry it on is less than that engaged in the lake commerce with Canada.

STATEMENT of the Quantity of Flour, Wheat, Peas, Pork, Lard, and Butter, Exported from Canada in each Year, from 1835 to 1844 :—

The value of imports into Lower Canada, in 1840, amounted to 1,903,043*l.* ; the value of exports to 1,625,685*l.*, of which the value of timber was 952,826*l.*

In 1842, the duty on British American timber was reduced from 10*s.* to 1*s.* per load; on foreign timber, from 55*s.* to 30*s.*; and in 1843, to 25*s.* per load. This change was predicted by the timber merchants in the North American trade to ruin Canada.

The exports of timber, in 1840, consisted of pine timber 382,287 tons ; oak, 36,790 tons ; elm, 44,696 tons ; ash, beech, &c., 5404 tons ; staves, number, 71,594,477 ; masts and yards, 5347 ; oars, 31,030 ; deals, planks, &c., 2,480,626.

In 1842, 1843, and 1844, the ships which arrived at Quebec from the sea, chiefly for timber, down to the 11th of November, were as follows :

A circular issued by one of these houses at Quebec, on the 5th of December, 1844.

" In the early part of the season, the high price of white pine in Liverpool, was generally supposed to result from the barrenness of the market there, but every branch of trade in England being prosperous, caused a great demand for this great staple, and each succeeding steamer brought more flattering accounts; freights advancing from 30s. to 35s., and subsequently to 38s. and 39s., and vessels scarce and not to be procured. By our advices to the 4th ultimo, we are informed that the unparalleled number of 110 arrivals of timber ships in the port of Liverpool, in the month of October, had little effect on the market, which was wonderfully supported, notwithstanding the addition, in such a short period, of upwards of 61,000 tons of *timber*. The number of mills erecting in the manufacturing districts and the rage for railroads, which are projected in every part of the United Kingdom, with the immense improvements in Birkenhead for the increased dock accommodation in the port of Liverpool, are all sensible causes of the great consumption of our timber.

" Whether these will continue, or whether the ensuing season will be equally beneficial to our friends on the St. Lawrence and the Ottawa, it is difficult to conjecture; and acting on the rule we have laid down for ourselves in the issue of our prices current, of merely advising what has taken place in the market, and carefully abstaining from hazarding any opinion of prospective prices, we will content ourselves by simply stating the impression generally prevalent is, that a large and active demand will be experienced next year, and an unusually large stock will be got out to meet it.

" So much, however, depends on our weather in winter and spring, that much uncertainty of the quantity manufacturing getting to market must always exist.

" By the supervisor's return, the quantity of timber received during the year 1844, is as follows:—

DESCRIPTION.	Feet.	DESCRIPTION.	Feet.
	number.		number.
White pine.....	12,150,964	Butternut.....	3,040
Red pine.....	4,164,317	Basswood	7,919
Oak	709,540	Tamarack	19,925
Elm.....	660,964	Round maple.....	255
Ash.....	128,458	Hemlock.....	1,001
Birch.....	73,142	Poplar	45
Maple.....	821	Walnut	3,489

"Taking into consideration a small quantity of timber wintering over last year without being measured, and which of course is not included in the above return, our exports of square timber, and that used in our ship-yards, will not vary much from the following :—

DESCRIPTION.	Feet.	DESCRIPTION.	Feet.
	number.		number.
White pine.....	11,950,438	Elm.....	1,208,988
Red pine.....	4,669,149	Ash.....	122,316
Oak.....	1,213,110	Birch.....	61,309

It may be observed, that scarcely any timber shipped from Canada, is the produce of the United States, and that a great quantity of timber and lumber is exported from Canada to the latter.

American Wheat Shipments by the Welland canal to Canada.—The canal is thirty-eight miles long, ten feet deep, and has a large number, some forty locks, to overcome a rise of 360 feet, existing between Port Dalhousie, on Lake Ontario, and Port Colborne, on Lake Erie.

Tolls received upon the Welland canal for—

	1835	1836	1837	1838	1841
	£	£	£	£	£
Tolls.....	5807	5754	5516	6740	20,210

In 1840, of the total amount of wheat shipped from Lake Erie, *viâ* the Welland canal, 707,000 bushels were received at Oswego, together with 8464 barrels of flour. Among the items shipped from Oswego that year, through that canal, were 153,538 barrels of salt.

Progress of Toronto.—The population of this rapidly improving city, has doubled itself within the last ten years. The number of inhabitants in June, 1843, according to the census, was 17,805; at present the number exceeds 20,000. The revenue of the port of Toronto, for the year ending the 5th of January, 1844, is upwards of 18,000*l.*, of which fully two-thirds arise on goods imported from the United States. The total exports during the same period, amount to 105,000*l.*, of which not more than 2506*l.* were sent to the United States. The amount of specie exported to Buffalo, is about 2500*l.* per week.

NUMBER of Emigrants arrived at Toronto, from the 16th of May to the 16th of November, 1844.

Commerce of Hamilton, Lake Ontario.—In 1842, the receipt of customs at the port of Hamilton amounted to 7604*l.*, which was considered to be a large sum when compared with Toronto, which for the same period produced only 8300*l.* During the last year it will be seen that the customs amounted to 12,190*l.*, being an excess over the previous year of 4586*l.* The canal tolls have also increased to 1986*l.*, which, added to the customs, makes the very large sum of 14,176*l.* To this sum may be added duty on articles in bond, 2750*l.* so that the whole amount of customs and tolls for the year, is 16,926*l.* This great increase is owing to the very advantageous natural position of Hamilton. Placed at the head of Lake Ontario, having excellent roads diverging from it in all directions, an extensive and fertile country, hardy and industrious farmers, and skilful artisans, enlightened and enterprising merchants—the town of Hamilton must in a few years become one of the largest in Western Canada, and also one of the most prosperous. “Among not the least causes to accomplish this end, will be the enlargement of Burlington canal, which is now in progress. When this is completed, aided by the improvements in the navigation of the St. Lawrence, the appearance of sea-going vessels in our harbour will be no novelty.”—*Express.*

“PORT HOPE.—NEWCASTLE DISTRICT.—*Produce of Wheat.*—During the past winter there has been more wheat purchased in this town than in any former season. There are more than 100,000 bushels stored here now, and it is confidently believed there is a third of what was raised in the back townships to come in, which, when the roads get a little better, will be brought forward. In Windsor, we understand there are about 60,000 ; in Oshawa, 80,000 ; Bowmanville, Newcastle, and Bond Head, respectively, as much more, which will make at the least 500,000 bushels. This is independent of what has been purchased in Peterborough, in the back stores in Cavan and Monaghan, the greater part of which will pass through our harbour to market; and that purchased in Cobourg; in all we may safely say between 700,000 and 800,000 bushels, at the average price of 4s. to 4s. 3d., making the round sum paid for this article in this neighbourhood, at least 150,000*l.* This trade will continue to increase, and we have no doubt that in a very few years 1,000,000 of bushels will be purchased annually at these places.”—*Port Hope Gazette.*

STATEMENT of the Population of Upper Canada, with the Assessed Value of Taxable Property, Number of Acres of Uncultivated Land liable to Tax, and Cultivated Land in the Years 1825, 1835, 1838, 1839, 1840, and 1841.

YEARS.	Population.	Assessed Value of Property.	Uncultivated Land liable to Tax.	Cultivated Land.

CHAPTER XVIII.

COMMERCE OF THE MISSISSIPPI AND ITS TRIBUTARIES.

The settlement, cultivation, trade, and navigation of the regions drained by the Mississippi, Missouri, the Ohio, and the numerous tributaries of those rivers, are subjects unparalleled in their rise, progress, and magnitude.

Within the duration of not more than the ordinary long life of a human being, the empire of the west has risen to its present magnitude. A few straggling hunters were *trapping* amidst the forests of Kentucky, when they heard the intelligence of the fight at Lexington. To the spot where they had erected their camp they gave the name of their battlefield. Such was the origin of the first settlement, and the first city in the great western valley.

Before this period there was no craft, we believe, of greater capacity than the canoe of the red men, navigating the western waters at least not farther north than Louisiana. After the beech bark canoe, and the canoe formed of a single tree, scooped out by tools or by burning, the pirogue appeared, also formed by scooping out one or more trees, and joining them together in the form of a vessel. The *barge*, the *flat boat*, and the *keel-boat*, afterwards appeared on the great rivers of America. The barge was the largest of the three.

Judge Hall, in his very interesting notes on the western states, observes of these barges:—

“They had the greatest breadth, and the best accommodations for passengers, the keel was longer, had less depth, and was better fitted to run in narrow and shallow channels. They were navigated by a rude and lawless class of men, who became distinguished as well for their droleries, as for their predatory and ferocious habits. In the then thinly scattered state of the population, their numbers rendered them formidable, as there were few villages on the rivers, and still fewer settlements, which contained a sufficient number of able-bodied men, to cope with the crew of a barge, consisting usually of thirty or forty hands; while the arrival of several of these boats together, made them completely masters of the place. Their mode of life, and the facilities they possessed for evading the law, were such as would naturally make them reckless. Much of the distance through which they travelled in their voyages, was entire wilderness, where they neither witnessed the courtesies of life, nor felt any of the restraints of law; and where for days, perhaps weeks, together, they associated only with each other. The large rivers whose meanders they pursued, formed the boundaries of states, so that living continually on the lines which divided different civil jurisdictions, they could pass with ease from one to the other, and never be made responsible to any.”

One of the earliest attempts to navigate the Ohio, down to the Mississippi, and to New Orleans, was in 1776, when Messrs. Gibson and Linn, the grandfather of Dr. Linn, afterwards a senator in Congress from Missouri, descended by water from Pittsburg to New Orleans, to procure military stores for the troops stationed at the former place. They succeeded, and in the spring of 1777 brought back a cargo of 136 kegs of gunpowder.

“In the earlier periods of this navigation, the boats employed in it were liable to attacks from the Indians, who employed a variety of artifices to decoy the crews into their power. Sometimes a single individual, disguised in the apparel of some unhappy white man, who had fallen into their hands, appeared on the shore making signals of distress, and counterfeiting the motions of a wounded man. The crew, supposing him to be one of their countrymen, who had escaped from the Indians, would draw near the shore for the purpose of taking him on board; nor would they discover the deception until, on touching the bank, a fierce band of painted warriors, would rush upon them from an artfully contrived ambuscade. Sometimes the savages crawled to the water's edge, wrapped in the skins of bears, and thus allured the boatmen, who were ever ready to exchange the oar for the rifle, into their power. But the red warriors were often sufficiently numerous to attempt by open violence, that which they found it difficult to accomplish by artifice, against men as wary, and as expert in border warfare, as themselves; and boldly pursued the boats in their canoes, or rushed upon the boatmen, when the incidents, or the perils of their navigation, drove them to the shore.

“These boats, but rarely using sails, and receiving only an occasional impulse from their oars, descended the stream with a speed but little superior at any time to that of the current; while

they met with many accidents and delays to lengthen the voyage. A month was usually consumed in the passage from Pittsburg to New Orleans, while the return voyage was not effected in less than four months, nor without a degree of toil and exposure to which nothing but the hardiest frames, and the most indomitable spirits, would have been equal. The heavily laden boats were propelled against the strong current by poles, or, where the stream was too deep to admit the use of those, drawn by ropes. The former process required the exertion of great strength and activity, but the latter was even more difficult and discouraging—as the labourer, obliged by the heat of the climate to throw aside his clothing, and exposed to the burning rays of the sun, was forced to travel on the heated sand to wade through mire, to climb precipitous banks, to push his way through brush, and often to tread along the undermined shore, which giving way under his feet precipitated him into the eddying torrent of the Mississippi. After a day spent in toils which strained every muscle to its utmost power of exertion, he threw himself down to sleep, perhaps in the open air, exposed to the cold damps and noxious exhalations of the lower Mississippi, and the ferocious attacks of millions of musquitoes, and reposed as unconscious of danger, or inconvenience, as the native alligator which belloved in the surrounding swamps.

“The flat boat was introduced a little later than the others. It is a rough strong boat, with a perfectly flat bottom, and perpendicular sides; and covered throughout its whole length. Being constructed to float only with the current, it never returns after descending the river. These boats were formerly much used by emigrating families, to transport themselves down the Ohio, and are still built in great numbers on the various tributary streams, and floated out in high water, with produce for New Orleans.”

Judge Hall quotes the following from *The Centinel of the North-western Territory*, January 11, 1794.

“OHIO PACKET BOAT.—Two boats for the present will start from Cincinnati for Pittsburg, and return from Cincinnati in the following manner, viz:—

“First boat will leave Cincinnati this morning at eight o’clock, and return to Cincinnati, so as to be ready to sail again in four weeks from this date.

“Second boat will leave Cincinnati on Saturday the 30th inst., and return to Cincinnati in four weeks as above.

“And so regularly each boat performing the voyage to and from Cincinnati to Pittsburg *once in every four weeks*.

“Two boats, in addition to the above, will shortly be completed and regulated in such a manner that one boat of the four will set out weekly from Cincinnati to Pittsburg, and return in like manner.

“The proprietor of these boats, having maturely considered the many inconveniences and dangers incident to the common method hitherto adopted of navigating the Ohio, and being influenced by a love of philanthropy and a desire of being serviceable to the public, has taken great pains to render the accommodations on board the boats as agreeable and convenient as they could possibly be made.

“No danger need be apprehended from the enemy, as every person on board will be under cover made proof against rifle or musket balls, and convenient port-holes for firing out of. Each of the boats are armed with six pieces carrying a pound ball; also a number of good muskets, and amply supplied with plenty of ammunition; strongly manned with choice hands, and the masters of approved knowledge.

“A separate cabin from that designed for the men, is partitioned off in each boat for accommodating ladies on their passage. Conveniences are constructed on board each boat, so as to render landing unnecessary, as it might, at times, be attended with danger.

“Rules and regulations for maintaining order on board, and for the good management of the boats, and tables accurately calculated for the rates of freightage, for passengers and carriage of letters to and from Cincinnati to Pittsburg; also a table of the exact time of the arrival and departure to and from the different places on the Ohio, between Cincinnati and Pittsburg, may be seen on board each boat, and at the printing office in Cincinnati. Passengers will be supplied with provisions and liquors of all kinds of the first quality, at the most reasonable rates possible. Persons desirous of working their passage, will be admitted on finding themselves; subject, however, to the same order and directions from the master of the boats as the rest of the working hands of the boat’s crew.

“An *Office of Insurance* will be kept at Cincinnati, Limestone, and Pittsburg, where persons desirous of having their property insured may apply. The rates of insurance will be moderate”

Such were the vessels by which the navigation and trade of the western rivers was carried on, previous to the year 1811. A few bad roads crossed the mountains, and some waggons were dragged over them with such difficulty that a

large portion of the merchandise was carried on the backs of horses. A few years afterwards, a delegate from Kentucky was considered a visionary for requesting of Congress the establishment of a mail to Pittsburg, to be carried on horseback once in two weeks. "He was told," says Judge Hall, "that such a mail was not needed, that it probably would never be required, and that the obstacles of the road were insuperable. That venerable patriot has lived to see the establishment of *two* daily mails on the same route; while the canals, the railways, and the turnpikes that lead to the west, have rendered it accessible, with ease and safety to every species of vehicle."

"The first steamboat built on the western waters," says a writer in the *Western Monthly Magazine*, "was the *Orleans*, built at Pittsburg in 1811; there is no account of more than seven or eight built previously to 1817; from that period they have been rapidly increasing in number, character, model, and style of workmanship, until 1825, when two or three boats built about that period were declared by common consent to be the finest in the world. Since that time, we are informed, that some of the New York and Chesapeake boats rival, and probably surpass us, in richness, and beauty of internal decoration. As late as 1816, the practicability of navigating the Ohio with steamboats was esteemed doubtful; none but the most sanguine augured favourably. The writer of this well remembers that in 1816, observing, in company with a number of gentlemen, the long struggles of a stern-wheel boat to ascend Horse-tail ripple (five miles below Pittsburg) it was the unanimous opinion, that 'such a contrivance' might conquer the difficulties of the Mississippi, as high as Natchez, but that we of the Ohio must wait for some 'more happy century of inventions.'"

"About the time," says Judge Hall, "that Fulton was building his first boat at Pittsburg, he travelled across the mountains in a stage, in company with several young gentlemen from Kentucky. His mind was teeming with those projects, the successful accomplishment of which has since rendered his name so illustrious—and his conversation turned chiefly upon steam, steamboats, and facilities for transportation. Upon these subjects he spoke frankly, and his incredulous companions, much as they respected the genius of the projector, were greatly amused at what they considered the extravagance of his expectations. As the journey lasted several days, and the party grew familiar with each other, they ventured to jest with Mr. Fulton, by asking if he could do this, and that by steam; and a hearty laugh succeeded whenever the single-minded and direct inventor asserted the power of his favourite element. At length, in the course of some conversation on the almost impassable nature of the mountains, over which they were dragged with great toil, upon roads scarcely practicable for wheels, Mr. Fulton remarked, 'The day will come, gentlemen—I may not live to see it, but some of you who are younger probably will—when carriages will be drawn over these mountains by steam engines, at a rate more rapid than that of a stage upon the smoothest turnpike.' The apparent absurdity of this prediction, together with the gravity with which it was uttered, excited the most obstreperous mirth in this laughter-loving company, who roared, shouted, and clapped their hands, in the excess of their merry excitement. This anecdote was repeated to us by one of that party; who, two years ago, on finding himself rapidly receding from Baltimore in a railroad car, recollected the prediction of Fulton, made twenty years before."

The *Orleans*, 400 tons, the first boat built at Pittsburg, was owned and constructed by Mr. Fulton, and sailed from Pittsburg in December, 1812, and arrived at New Orleans about the 24th of the same month. This vessel continued to run between New Orleans and Natchez: the voyages averaged seventeen days; until wrecked near Baton Rouge, in 1813 or 1814, by striking a snag on an upward bound passage.

The *Comet*, twenty-five tons, built at Pittsburg with a stern-wheel, and vibrating cylinder, made a voyage to Louisville in the summer of 1813, descended to New Orleans in the spring of 1814, made two voyages thence to Natchez, and was sold,—and the engine put up in a cotton gin.

The *Vesuvius*, 340 tons, built at Pittsburg, by Mr. Fulton, and owned by a company at New York and New Orleans, sailed for New Orleans in the spring of 1814. She sailed from New Orleans for Louisville, about the 1st of June following; grounded on a sand bar 700 miles up the Mississippi, where she lay until the 3rd of December following, when the river rose, and floated her off. She returned to New Orleans, where she ran aground a second time on the Battery, where she remained until March 1st, when a rise of water set her afloat. She was then employed between New Orleans and Natchez. Shortly after she caught fire near New Orleans and burned to the water's edge. Her hull was afterwards raised and built upon, at New Orleans. She was since in the Louisville trade, was sold to a company at Natchez, and condemned in 1819.

The *Enterprise*, forty-five tons, was built at Brownsville, Pennsylvania, on the Monongahela, by Daniel French, under his patent, and owned by a company at that place, made two voyages to Louisville in the summer of 1814. On the 1st of December, she took in a cargo of Ordnance stores at Pittsburg, and sailed for New Orleans, and arrived at New Orleans on the 14th of the same month. She was then despatched up the river in search of two keel-boats, laden with small arms, for General Jackson's army, which had been delayed on the way; and returned with the cargoes of these after an absence of six days and a half, in which time she ran 624 miles. For some time after she was actively engaged in transporting troops. She made one voyage to the Gulf of Mexico as a cartel, one voyage to the rapids of Red river with troops, and nine voyages to Natchez. She started for Pittsburg on the 6th of May 1817, and arrived at Louisville on the 30th, twenty-five days out, being the first steamboat that ever arrived at that port from New Orleans. The citizens of Louisville gave a public dinner to Captain Shreve for having accomplished in twenty-five days, a trip, which, previous to that time, had never been performed by the barges and keel-boats in less than three months.

Before the introduction of steam navigation, about 1817, the trade of the upper Mississippi and Missouri scarcely existed, and the whole upward commerce of New Orleans was conveyed in about twenty barges, carrying each about 100 tons, and making but one trip a year: a longer period than required to make an East India or a China voyage. On the upper Ohio, about 150 keel-boats were employed, each of the burden of about thirty tons, and making the trip to and from Pittsburg and Louisville, about three times a year. The whole tonnage of the boats navigating the Ohio and lower Mississippi was then about 6500 tons.

Judge Hall speaking of steam navigation on the Mississippi and Ohio:—

“The first advance was slow, and the prospects discouraging. The *fourth* boat that descended the river, was the *first* to reascend as far as Louisville, and even then it was considered doubtful whether steamboats could be rendered useful as a mode of navigation for the ascending trade.

It was not until 1816, when the boat which was about the *ninth* in the order of building, having been conducted from Louisville to New Orleans and back in forty-five days, by Captain Henry M. Shreve, the question of practicability was considered as settled.

"Many of the obstacles which impeded the rapid advance of steamboat navigation were such as were incident to an infant and imperfect state of the art of constructing both boats and engines; while others were inseparable from the condition of the country. In accounting for the length of the earliest voyages, something must be allowed to both these classes of causes, and among the latter may be mentioned the important facts, that the shores of the Ohio and Mississippi were then comparatively unsettled, fuel was not an article of traffic, but was procured from the growing forest by the crews of the boats, and used in its green state; while accidental injuries were repaired with equal inconvenience and delay.

"The *General Pike*, built at Cincinnati, in 1818, and intended to ply as a packet between Maysville, Cincinnati, and Louisville, is said to have been the first steamboat constructed on the western waters for the exclusive convenience of passengers. Her accommodations were ample, her apartments spacious and superbly furnished, and her machinery of superior mechanism. She measured 100 feet keel, and twenty-five feet beam, and drew only three feet and three inches water. The length of her cabin was forty feet, the breadth twenty-five feet, in addition to which were fourteen state rooms. The boats previously built had been intended solely for the transportation of merchandise; these objects have subsequently been successfully united.

"The *Calhoun*, 80 tons, built at Frankfort, in 1818, the *Expedition*, 120 tons, and the *Independence*, 50 tons—the two last built at Pittsburg—were constructed for the exploration of the Missouri river, in what was popularly termed the Yellow Stone Expedition, projected by Mr. Calhoun, while secretary of war. The *Independence* was the first steamboat that ascended the powerful current of the Missouri.

"The *Post Boy*, 200 tons, built at New Albany, by Captain Shreve, and others, in 1819, was intended for the conveyance of the mail between Louisville and New Orleans, under an act of Congress passed in March, 1819. This was the first attempt on the western waters to carry the mail in steamboats.

"The *Western Engineer*, was built near Pittsburg, in 1818, under the direction of Major S. H. Long, of the United States Topographical Engineers, for the expedition of discovery to the sources of the Missouri, and the Rocky mountains, which was afterwards so honourably accomplished by himself and his companions. This boat ascended as high as the Council Bluffs, about 650 miles above St. Louis, and was the first steamboat, that reached that point."

In 1829, Mr. Morgan Neville wrote the following remarks:—

"The average cost of a steamboat is estimated at 100 dollars per ton; the repairs made during the existence of a boat, amount to one-half the first cost. The average duration of a boat has hitherto been about four years; of those built of locust, lately, the period will probably be two years longer. The amount of expenditure in this branch of business on the western waters, then, for the last ten years, will in some measure be shown by the following calculation:—

56,000 tons, costing 100 dollars per ton, amount to.....	dollars. 5,600,000
Repairs on the same.....	2,800,000

Expending in building and repairing in ten years..... 8,400,000

"The annual expenditure of steamboats is very difficult to be arrived at: the importance of this expenditure, however, to the towns on our rivers, and to the whole extent of country running along their shores, may be estimated from the following calculation of the item of fuel alone, for one year—take the present year, 1829. We have now in operation above 200 boats, the tonnage of which may be stated at 35,000 tons.

"It is calculated that the business of each year lasts eight months; deduct one-fourth for the time lost in port, and we have six months, or 180 days, of running time. Each boat is presumed to consume one cord of wood, for every twelve tons, every twenty-four hours:—

The 35,000 tons then consume per day.....	cords. 2,917
Or, during the six months.....	525,060

"The price of wood varies from one dollar and a half, to five dollars per cord; a fair average would place it at two dollars twenty-five cents per cord. This makes the expenditure for fuel alone, on the banks of our rivers, 1,181,385 dollars, for this year. The other expenditures, while running, are calculated by the most experienced and intelligent owners, to be equal to 1,300,000 dollars, which gives the total expenditure, for 1829, at 2,481,385 dollars.

"This calculation and estimate, then, which are both made lower than the facts justify, present these results:—

	dollars.
The amount of first cost of steamboats, since 1817.....	5,600,000
Repairs on the same.....	2,800,000

Total amount of expenditure, produced by the introduction of steam-boats, for building and repairs..... 8,400,000

"We cannot better illustrate the magnitude of the change in every thing connected with western commerce and navigation, than by contrasting the foregoing statement, with the situation of things at the time of the adoption of steam transportation, say in 1817. About twenty barges, averaging 100 tons each, comprised the whole of the commercial facilities for transporting merchandise from New Orleans to the 'Upper country;' each of these performed one trip down and up again to Louisville and Cincinnati within the year. The number of keel boats employed in the upper Ohio, cannot be ascertained, but it is presumed that 150 is a sufficiently large calculation to embrace the whole number. These averaged thirty tons each, and employed one month to make the voyage from Louisville to Pittsburg, while the more dignified barge of the Mississippi made her trip in the space of 100 days, if no extraordinary accident happened to check her progress. Not a dollar was expended for wood, in a distance of 2000 miles, and the dweller on the banks of the Ohio thought himself lucky if the reckless boatmen would give the smallest trifle for the eggs and chickens which formed almost the only saleable articles on a soil whose only fault is its too great fertility. Such was the case twelve years since. The Mississippi boats now make five or six trips within the year, and are enabled, if necessary, within that period to afford to that trade 135,000 tons. Eight or nine days are sufficient on the upper Ohio, to perform the trip from Louisville to Pittsburg and back. In short, if steam has not realised the hyperbole of the poet in 'annihilating time and space,' it has produced results scarcely surpassed by the introduction of the art of printing."

In 1834, he added the following:—

"On the 1st day of January, 1834, an official list of steamboats from an authentic source, gives the whole number of 230, then in existence, whose aggregate amount of tonnage is equal to about 39,000 tons. Allowing the cost of building at a rate much lower than the rule adopted three years since, the capital now invested in this stock will exceed 3,000,000 dollars. The expense of running may be put down nearly as contained in the following scale:—

	dollars	cts.
60 boats over 200 tons, 180 running days, at 140 dollars per day.....	1,512,000	00
70 boats, from 120 tons to 200 tons, 240 running days, at 90 dollars per day.....	1,512,000	00
100 boats, under 120 tons, 270 running days, at 60 dollars per day.....	1,620,000	00

Total yearly expenses..... 4,644,000 00

"This sum may be reduced to the different items producing it in the following proportions, viz:—

	dollars	cts.
For wages, 36 per cent, equal to.....	1,671,840	00
" wood, 30 per cent, equal to.....	1,393,200	00
" provisions, 18 per cent, equal to.....	835,920	00
" contingencies, 16 per cent, equal to.....	743,040	00

"This result is truly striking to those who were accustomed to the state of things on our rivers within twenty years. The difference in the amount of wages paid, is in itself very considerable; but the item of fuel is one created exclusively by steamboats; and when it is considered that nearly 1,500,000 dollars is expended every year, at a few points on the Mississippi valley, it presents a vast field for speculation. The immense forests of beech and other timber unfit for agricultural purposes, were, before, not only useless, but an obstacle to the rugged farmer, who had to remove them before he could sow and reap. The steamboat, with something like magical influence, has converted them into objects of rapidly increasing value. He no longer looks with despondence on the denseness of trees, and only regrets that so many have already been given to the flames, or cast on the bosom of the stream before him.

"At the present period, the steamboats may be considered as plying as follows, viz:—

boats	tons.
25 over 200 tons, between Louisville, New Orleans, and Cincinnati, measuring..	8,484
7 between Nashville and New Orleans, measuring.....	2,585
4 between Florence and New Orleans, measuring.....	1,617
4 in the St. Louis trade, measuring.....	1,002
7 in the cotton trade, measuring.....	2,016
57 not in established trades, from 120 to 200 tons.....	8,641
The balance under 120 tons in various trades.....	14,655
	<u>39,000</u>

"In the New Orleans and Louisville trade, the boats over 200 tons make about 150 trips in prosperous seasons; those of smaller size, make from fifty to sixty trips. But to go into an estimate of the number of voyages made by the boats in the different trades is impossible, because no regular data are furnished, and the result depends upon a variety of contingencies.

"Previous to 1817, about twenty barges afforded the only facilities for transporting merchandise from New Orleans to Louisville and Cincinnati. These, making but one trip in the year, gave the means of bringing up only 2000 tons. The present tonnage in this trade exclusively having been stated to be 8484 tons, gives the amount employed, calculating 150 trips in the season, to be 50,904 tons; a cause capable of producing a revolution in sixteen years hardly equalled in the annals of history. The effects upon western commerce have been immense. The moral changes alone which are felt throughout the west on prices is almost incalculable: the imported article has fallen in a ratio equal to the increased price of western products. In looking back at the old means of transportation, we cannot conceive how the present demand and consumption could have been supplied by them.

"To those who have been acquainted with the early mercantile history of our country, when it was no uncommon thing for a party of merchants to be detained in Pittsburg from six weeks to two months, by low water, or ice, the existing state of things is truly gratifying. The old price of carriage of goods from the Atlantic seaboard to Pittsburg, was long estimated at from five to eight dollars per 100 lbs. We have instances in the last five years, of merchandise being delivered at the wharf of Cincinnati for one dollar per 100 lbs., from Philadelphia, by way of New Orleans.

"It may not be useless or uninteresting to give an idea of the *mortality* among steamboats in a given time. It is not pretended that any decided inference can be drawn from this statement, or that the facts go to establish any fixed rule. But under the present situation of steamboat discipline and regulation a tolerably fair conclusion can be drawn from it. Taking the period then of two years, from the fall of 1831 till that of 1833, we have a list of boats gone out of service, of sixty-six: of these, fifteen were abandoned, as unfit for service; seven were lost by ice; fifteen were burnt; twenty-four snagged, and five destroyed by being struck by other boats. Deducting the fifteen boats abandoned as unseaworthy, we have fifty-one lost by accidents peculiar to the trade. In number, this proportion is over twelve per cent per annum; in tonnage, the loss is upwards of ten per cent. Amount snagged, 3721 tons; amount burned, 2330 tons."

A committee which was appointed some years ago, by a number of steamboat owners, to investigate the subject, satisfied itself—

"That, although the benefits conferred by steam navigation were incalculable, the stock invested in boats was, as a general rule, a losing investment. In a few cases, owing to fortuitous events, or to the exercise of more than usual prudence, money has been made; but the instances are so few as not to affect the rule. One gentleman, who has been engaged for years in the ownership of steamboats, and has been peculiarly fortunate in not meeting with any loss by accident, assured the writer, that his aggregate gain during the whole series of years, was only about six per cent per year, on the capital invested. These facts go far towards accounting for the enormous proportion of accidents and losses which occur upon our rivers. A few instances, in which large profits were realised, induced a great number of individuals to embark in this business, and the tonnage has always been greater than the trade demanded. The accidents, which are almost wholly the result of bad management, were set down as among the unavoidable chances of the navigation, and instead of adopting measures to prevent them, they were deliberately subtracted from the supposed profits, as matters of course. As the boat was not expected to last more than four or five years, at best, and would probably be burnt, blown up, or sunk within that period, it was considered good economy to reduce the expenditures, and to make money by any means, during the brief existence of the vessel. Boats were hastily and slightly built, furnished with cheap engines, and placed under the charge of wholly incompetent persons; the most inexcusable devices were resorted to to get freight and passengers, and the most criminal indifference to the safety of the boat and those on board, observable during the trip."

Judge Hall observes, in 1837:—

"The danger of injury to boats from snags, has now become greatly diminished in the Mississippi, and has almost entirely ceased in the Ohio, in consequence of the measures adopted for the removal of those obstacles.

"The burning of boats must be the result of carelessness; and the dreadful consequences arising from collision, are produced by negligence and by design. There is scarcely a conceivable case in which boats may not avoid running against each other in the night; and there are many instances in which the officers of steamboats have been induced, by a ferocious spirit of rivalry, or some other unworthy motive, to run against weaker boats in such a manner as to sink them instantly.

"It is also true, that much of the evil alluded to is attributable to the precipitancy and culpable negligence with regard to their own safety and comfort of the passengers. The accidents are almost wholly confined to insufficient or badly managed boats, and the traveller who would be cautious in embarking only in those of the more respectable class would almost uniformly insure himself against danger. A choice of boats, embracing every variety, from the best, to those which are wholly unseaworthy, is presented at all our principal places of embarkation. Yet such is the feverish impatience of delay, evinced by most travellers in our country, that the great majority hasten on board the first boat which offers, regardless of her character, and only anxious to be moving forward, under any discomfort, and at every hazard. The bad boats receive undue patronage, the best do not meet the preference to which they are entitled, and are not compensated for the extra expenditure bestowed upon their outfit and management; and the inducements to accommodate the public well being weakened, neither the owners nor officers of steamboats feel the same solicitude for the reputation of their boats, nor the same degree of responsibility, which would occur if the public patronage was more judiciously bestowed."

The following remarks are from a letter to the secretary of the treasury, from Mr. William C. Redfield, agent of the steam navigation company at New York, and are considered as embracing the steam navigation of the whole union:—

"The contests for speed, or practice of racing, between rival steamboats, has been the cause, and perhaps justly, of considerable alarm in the community. It is remarkable, however, that as far as the information of the writer extends, there has no accident occurred to any boiler which can be charged to a contest of this sort. The close and uniform attention which is necessarily given to the action and state of the boilers and engines, in such contests, may have had a tendency to prevent disaster. But this hazard, as well as the general danger of generating an excess of steam, is greatly lessened by the known fact, that in most steamboats the furnaces and boilers are not competent to furnish a greater supply of steam than can be used with safety, with an ordinary degree of attention on the part of the engineers.

"The magnitude and extent of the danger to which passengers in steamboats are exposed, though sufficiently appalling, is comparatively much less than in other modes of transit with which the public have been long familiar; the accidents of which, if not so astounding, are almost of every day occurrence. It will be understood that I allude to the dangers of ordinary navigation, and land conveyance by animal power on wheel carriages. In the former case, the whole or greater part of both passengers and crew are frequently lost, and sometimes by the culpable ignorance or folly of the officers in charge, while no one thinks of urging a legislative remedy for this too common catastrophe. In the latter class of cases, should inquiry be made for the number of casualties occurring in various districts in a given number of years, and the results fairly applied to our whole population and travel, the comparatively small number injured or destroyed in steamboats would be matter of great surprise to those not accustomed to make such estimates upon passing events. It is also worthy of notice, that if the average annual loss of life by the electric stroke were ascertained in the manner above proposed, the results would probably show a loss of life by this rare casualty far exceeding that which is occasioned by accidents in steamboats."

We extract from an interesting report of a committee of the house of representatives, in Congress, made in 1832, by Mr. Wickliffe of Kentucky, the following tabular statement of the steamboat accidents in the United States previous to that date.

STEAMBOAT Explosions in the United States, previous to 1831.

DESCRIPTION.	Killed.	Wounded.
	number.	number.
13 High pressure explosions.....	115	54
27 Low pressure ditto.....	95	29
12 Character of engines unknown, supposed to be chiefly high pressure.....	46	21
52 Total	256	104

"In the year 1832 it was estimated, that besides the steamboats, there were 4000 flat boats annually descending the Mississippi, whose aggregate capacity would be 160,000 tons. As these do not return, the loss on them would amount to 420,000 dollars, and the expense of loading, navigating, and unloading them, 960,000 dollars; making the whole annual expenditure, upon this class of boats, 1,380,000 dollars.

"In the same year the aggregate cost of steamboats, the expenses of running them, interest, wear and tear, wood, wages, and subsistence of crews and passengers, was estimated at 5,906,000 dollars.

"The total expenditure on steam and flat boats was, according to this calculation, 7,286,000 dollars.

"The value of the produce exported in these boats, together with the labour expended in and about them, was estimated at 26,000,000 dollars.

"The different descriptions of boats which navigated the western rivers that year, were supposed to give employment to 16,900 men, namely :—

	dollars.
To mechanics and labourers employed in building twenty steamboats, and repairing others	1,700
Wood cutters	4,400
Crews of steamboats ..	4,800
Building flat boats	2,000
Navigating flat boats to New Orleans	4,000
Total.....	16,900

"But adding to those who are directly engaged, the much larger number who are indirectly employed in making engines, and in furnishing, supplying, loading, and discharging boats, the whole number of persons deriving subsistence from this navigation, in 1832, was supposed to be 90,000. That number has since been greatly increased. During the last season there was built at Pittsburg and the neighbouring towns, about twenty-five steamboats, at Cincinnati and its neighbourhood, about twenty-five.

"From 1822 to 1827, the loss of property on the Ohio and Mississippi, by snags, including steam and flat boats, and their cargoes, amounted to 1,362,500 dollars. Loss in the same items, from the same cause, from 1827 to 1832, was 381,000 dollars.

COMPARATIVE View of the Number of Steamboats built at different Places on the Mississippi and Ohio Rivers, previous to 1837.

THE Proportions of the above to the several States in which Steamboats are built for the Western waters, are nearly as follows :

P L A C E S.	Number.	P L A C E S.	Number.	P L A C E S.	Number.
Ohio.....	226	Brought forward.....	498	Brought forward.....	567
Pennsylvania.....	216	Indiana.....	47	Tennessee.....	14
Kentucky.....	56	Virginia.....	22	Other places.....	7
Carried forward.....	498	Carried forward.....	567	Total.....	688

In the beginning of 1837, there were of the above 588 :—worn out, 129 ; destroyed by snags, 33 ; burnt, 35 ; destroyed by explosion of gunpowder, 1 ; sunk by collision with other steamboats, 8 ; sunk and otherwise destroyed, 59 ; total destroyed or worn out, 265 steamboats.

"The aggregate tonnage of these thirty-eight boats (custom-house measurement), is 8248 tons and the aggregate cost 568,000 dollars. Of the thirty-six boats built in 1843, the aggregate custom-house measurement was 8415 tons, and the aggregate cost 605,250 dollars. Of the boats built in Cincinnati in 1844, the average size is 219 tons, and the average cost 14,947 dollars. Of those built there in 1843, the average size was 236 tons, and the average cost 16,812 dollars. The cost per ton of the boats built in Cincinnati in 1844, was 68 dollars 87½ cents; the cost per ton of those built there in 1843, was 71 dollars 94 cents. These are interesting facts; and, for the purpose of presenting them more directly to the eye at a glance, we construct the following table:—

Y E A R S.	Tonnage.	Cost.	Average Size.	Average Cost.	Cost per Ton.
	number.	dollars.	tons.	dollars.	dlrs. cts.
1843.....	8415	605,250	236	16,812	71 94
1844.....	8248	568,000	217	14,947	68 87½

"A late number of the *Pittsburg Morning Herald* gives the names of 437 steamboats navigating the western and south-western waters; tonnage, in 1840, as follows:—

		St-ramboats.			Steamboats.
tons	tons	number.	tons	tons	number.
From 30 to 168 ...		78	From 400 to 500 ...		8
" 100 to 200 ...		212	" 500 to 600 ...		5
" 200 to 300 ...		105	" 600 to 700 ...		4
" 300 to 400 ...		24	" 700 to 800 ...		1

According to a statement in the *Merchants' Magazine*, in 1842 the navigation of the Mississippi was as follows:—

"There were 450 steamers, averaging each 200 tons, and making an aggregate tonnage of 90,000, so that it has a good deal more than doubled in eight years. Valued at eighty dollars the ton, they cost above 7,000,000 dollars, and are navigated by nearly 16,000 persons, at thirty-five to each. Besides these steamers, there are about 4000 flat-boats, which cost each 105 dollars, are managed by five hands a-piece (or 20,000 persons), and make an annual expense of 1,380,000 dollars. The estimated annual expense of the steam navigation, including fifteen per cent for insurance, and twenty per cent for wear and tear, is 13,618,000 dollars. If, in 1834, they employed an aggregate of 90,000 persons, they must now occupy at least 180,000. The boats, ever in motion when the state of the waters in which they ply permits, probably average each some twenty trips in the year. Those running from New Orleans to the more distant points of the river, make from eight to fifteen trips in the year; while those carrying the great trade from Pittsburg, Cincinnati, and Louisville, to St. Louis, perform some thirty annual trips. Others run between still nearer ports, and make more frequent voyages. But at twenty each, and carrying burdens far beyond their mere admeasurement of tonnage, their collective annual freight would be 1800 tons; to which, if that of 4000 flat-boats (each seventy-five tons) be added, we have a total freight, for the entire annual navigation of the Mississippi, of about 2,000,000 tons. The commerce which they convey (omitting the great number of passengers whom they waft in some 9000 trips) is of two sorts: that of the export trade to New Orleans, and that of supply and interchange between the different regions lying on the Mississippi and its tributaries. The latter is well ascertained to be considerably greater, as naturally happens in the internal trade of all wide and commercial countries, whose dealings with foreign lands never fail to fall far short of their exchanges with each other. The statistics collected at the two main points where the best means of information can be commanded (St. Louis and Cincinnati), estimate this internal traffic of the productions of the country itself at not less than 70,000,000 dollars annually; while those commodities shipped to New Orleans for exportation, are found to be 50,000,000 dollars more. The downward trade may thus be stated at 120,000,000 dollars; the upward, or return trade of foreign goods, or of those brought up the river from other parts of the Union, is reckoned at about 100,000,000 dollars. Thus, the entire amount of commodities conveyed upon the waters of the Mississippi does not, upon the best estimates, fall short of 220,000,000 dollars annually, which is but 30,000,000 dollars less than the entire value of the foreign trade of the United States exports and imports in 1841."

Total to St. Anthony Falls, 800 miles.

The charge or fare for passage on the Mississippi and Ohio rivers is about three dollars per 100 miles for long distances, and four to five cents per mile for short distances. Deck passengers, one dollar per 100 miles. The usual speed of the boats is six miles an hour up stream, and from ten to twelve down.

An important point of internal trade on the Ohio river, is the Portland and Louisville canal, through which the navigation of that great river passes.

STATEMENT of the Number of Boats that have passed through the Portland and Louisville Canal and Amount of Tolls received, during the undermentioned Years.

The trade of New Orleans with the upper countries of the Mississippi, Ohio, and Missouri, and especially the produce and merchandise brought, during several years, downwards to that city, will be found detailed in our account of New Orleans.

The principal places situated on the banks of the Mississippi and its tribu-

taries, between New Orleans and the mouths of the Ohio and Missouri, we have described in the account we have given of the respective states.

The great entrepôts of the internal trade of the upper counties are St. Louis and Cincinnati.

St. Louis, as late as the year 1836, was little more than a trading village; now (1845) contains a population of probably 40,000. (*See description of the state of Missouri and its towns.*) A great portion of the trade of the states of Illinois and Missouri, and the territories of Iowa and Wisconsin, centre at this town. Bricks in great quantity; and deals, boards, &c., produced by numerous steam saw-mills, and by several mills for planing; the produce of white-lead factories, grist-mills, oil-mills, and other fabrics also create an active trade. The amount of marine insurances effected at St. Louis, including boat-hulls and cargoes, and comprising only property floating on the rivers, is stated, in 1842, to have been 58,021,986 dollars.

The leading articles of export from St. Louis and of the adjacent country, of which it is the emporium, are lead, tobacco, furs, and peltries, hemp, flour, wheat, and other agricultural products; also horses, mules, hogs, and live cattle of various sorts, which are shipped to the south in flat or keel-boats.

The lead-mines of Washington, and other southern counties, are below St. Louis; although the lead is chiefly shipped from that port, by boats, to New Orleans. The quantities of this article received at St. Louis, from the Galena mines, for three years, ending in 1841, were as follow:—

1839.	.	.	.	.	.	pigs	375,000
1840	.	.	.	.	.	"	390,000
1841.	.	.	.	.	.	"	425,000

The quantity of lead received at New Orleans, for the same period, was as follows:—

1839.	.	.	.	.	.	pigs	300,000
1840	.	.	.	.	.	"	352,000
1841.	.	.	.	.	.	"	423,000

STATEMENT of the Shipments of Lead from Galena and Dubuqué, and all other Points on the Upper Mississippi, for 1841, 1842, and 1843.

Pigs Wisconsin copper, 1400 equal to 95,000 lbs.

"The above statement of the shipments of lead made from this section of the country this season, compared with that of 1841 and 1842, together with the number of steamboat departures, and number of keels and barges towed; shows 561,321 pigs against 447,859

pigs in 1842, and in small bar lead, 2410 pigs against 840 pigs; showing an actual increase in the shipments of lead 115,032 pigs

To which should be added that stopped by ice in 1842,
none of which reached St. Louis prior to the 10th of
April, 1843 25,142 „

Making an actual increase in the supply of 140,174 „

“That made into shot, say 5000 pigs, has gone to supply the lake borders, as well as the lead shipped that way. The steamboat arrivals show an increase of 49 over 1842, being 244 against 195.

“The article of Wisconsin copper is attracting notice, and will become a valuable article in the trade of this country. Our shipments this year amount in value to, say 11,000 dollars, and will, I think, in 1844, double that amount. In the Boston market it commands the same price as Peruvian copper, and with one house has the preference over it.

	dlsr.	cts.
“The value of the lead exported from here this year may be set down at 563,731 pigs of 70 lbs.=39,461,171 lbs.; at two dollars twenty- seven cents and one-third	937,202	00
And copper	11,000	00
Total	948,202	00

Galena, Dec. 15, 1843.”

Of the tobacco crop of Missouri, it is stated, by a house engaged in the trade, that the shipments, during the year 1841, were about 9000 hogsheads, of which 8500 passed through St. Louis, and of the subjoined quality and value:—

		dollars.	dollars.
2000 hhd. strips	worth in Europe	175=	350,000
2500 firsts	„ New Orleans	120=	300,000
2500 seconds	„ „	70=	175,000
1500 X's	„ „	50=	75,000
500 king's and bull's eye	„ „	25=	12,500
Total		912,500	

The crop for 1843, was estimated at above 12,000 hogsheads. The trade of the American Fur Company, and that of independent fur traders, including the fur trade of nearly all the northern and north-western Indians within the jurisdiction of the United States, concentrates at St. Louis. The value, to that city, of the trade in cloths, blankets, and other fabrics used in the fur trade traffic, exclusive of annuities, the pay of hands, and the outfits for expeditions, boats, &c., has been estimated, by individuals familiar with the trade, as exceeding 225,000 dollars. It has been computed that the exportation of furs, buffalo-robbs, and peltries, the proceeds of that trade, which go to the Atlantic cities, independently of the home consumption, and the quantity sent to the Ohio and other parts of the west, during the year 1841, was between 350,000 dollars and 400,000 dollars; and that the entire fur trade for that year could not fall short of 500,000 dollars. This trade includes the furs and skins that were collected by the various Indian tribes from the Mississippi to the Pacific, and from the Columbia to the California.

Hemp is becoming one of the most valuable products of the Missouri section of the country. There are, at St. Louis, two large manufactories of bagging and

bale rope, and several rope-walks. One thousand four hundred and sixty tons of hemp were exported in 1840, of which 1600 tons, grown in the state, were shipped to Kentucky, 380 tons to New Orleans. It is estimated that the crop of 1841 was double that of the preceding year; and, that, including the state of Illinois, the farmers of which are beginning to direct their attention to the manufacture of hemp, the total crop during the year 1842, was about 10,000 tons, valued at about 200,000 dollars.

St. Louis, Alton, Peoria, and most of the villages upon the upper part of the Mississippi and the Illinois river, export many thousand tons of pork in various states of preparation, as bulk and barrelled pork, bacon and lard. The value of the trade of Illinois, in that article, was estimated, in 1841, at 1,500,000 dollars.

The larger portion of the pork produced on the upper Mississippi has been consumed at the lead mines, by the Indians, and at the various military posts. A part of that which is produced on the Missouri is consumed by the Indians, the fur companies, and by the troops of the United States, stationed upon the frontier. In 1841, 174,000 barrels of flour, and 237,000 bushels of wheat were shipped from St. Louis, besides a great number of horses, mules, horned cattle, and hogs, which are sent southward by the flat or keel-boats.

Merchandise, of various sorts, required by the inland population is imported into St. Louis, as a *dépôt*, from the east, the south, and the Ohio, and estimated at the value of 25,000,000 dollars. Some of those articles imported into St. Louis, such as hardware, queen's, and China ware, German and French goods, linens, wines, and liquors, to the amount of several thousands of dollars, were imported in transit directly from Europe. An extensive trade is carried on between St. Louis and Santa Fé, and the States of New Mexico.—(*See Trade of the Prairies and Santa Fé hercafter.*)

On the Mississippi and its tributaries, 437 boats regularly plied during the year 1841, of which 150 were employed in the St. Louis trade, and eighty-three steamboats were, in part, owned by citizens of that place; some of which plied from the Ohio to Peoria, upon the Illinois, and to Galena, upon the Mississippi; others were employed in the direct trade from New Orleans to various points upon the Missouri, making St. Louis the rallying point. The steamboats, keel-boats, and flatboats, either carried direct from St. Louis to New Orleans, or sold along the river coast, flax-seed, tobacco, wheat, whiskey, shot, hides, hemp, castor oil, corn, meal, buffalo robes, bees'-wax, rope, butter, bagging, beans, furs and peltries, green fruit, dried tallow, bacon, beef, dried corn, flour, lard, lead, oats, potatoes, pork, onions, and live cattle.

Vicksburg, Natchez, and other minor places, are important points of shipment for the produce of the interior to New Orleans, the grand entrepôt of the Mississippian regions for foreign commerce, and the natural point of export to foreign countries.

CHAPTER XIX.

THE AMERICAN FUR TRADE.

THE trade for the purchase of the skins of wild animals commenced nearly with the first voyages to the coasts of America. We find that the early voyagers traded for furs within the Gulf of St. Lawrence, and along the shores and rivers of Acadia (now Nova Scotia and New Brunswick), and various parts of the country now forming the state of Maine, and the New England states, and of Cape Breton, St. John's Island, and Newfoundland. The skins of bears, foxes, martens, and some other wild animals, have continued from that period down to the present day, to form articles of commerce, to a moderate extent, in all those countries.

The great fur trade of North America commenced first at, and was carried on from, Canada, and it was, afterwards shared by adventurers who resorted to Hudson Bay.

The French colonists, who established themselves upon the St. Lawrence and the bordering lakes and streams, not discovering gems nor gold, directed their views to the mighty wilderness, and to the vast lakes and magnificent streams west of Quebec; and to the hunting of wild animals, whose furs were of great value in the foreign markets. Cardinal Richelieu organised, in 1627, the Company of New France, a chartered body comprised of 100 members, and granted to this company two ships of war. From that time the French colonists extended their posts along the great lakes and rivers of the west. These posts were the points of rendezvous of the fur traders—where European wares were exchanged for the skins of wild beasts.

The French fur trade was created as much by the character of the people as the spirit and policy of the government. The French colonists were scattered at different commanding points from the St. Lawrence to the banks of the Missouri. They consisted of three classes: the *seigneurs*, who were deemed the patricians of the country, and who held its advantages by royal charters; the ecclesiastics, who erected their crosses amid the near and distant Indian nations, and who were important agents of the French government in gaining the friendship of the aborigines; and the vagrant adventurers who were subjects of the feudal system under the *Coutume de Paris*, or the French colonial law.

The French American colonies were military and mercantile, far more than agricultural colonies. The feudal possessors of the country strove, by the course they pursued, rather to secure the greatest amount of temporary advantage than to perpetuate either their own hold on the soil, or the dominion of France over

the Canadas. Under noble leaders, and the Jesuits and priests, feudal, semi-military, and trading, as well as converting, or religious, expeditions, were despatched, from time to time, from the head-quarters of the government at Quebec and Montreal, with implements to erect posts, or factories upon the borders of the lakes, as places of deposit for European merchandise, and for the peltries collected, and as outposts for the protection of French power. Within the first fifty years after the foundation of Quebec, by Samuel de Champlain, we find factories extending to the shores of Lake Superior, at Detroit, Mackinaw, Duquesne, Chicago, Green Bay, St. Joseph, St. Marie, and St. Vincent. They consisted of rude houses, erected in the woods, thatched with bark, and in the midst of those buildings the Jesuit missionary erected a chapel, surmounted by a cross. A rude fort constructed with palisades contained a small garrison of soldiers.

The seigneurs, who, with the governor-general of Canada, were invested with the sovereign power, under the King of France, were generally partners in the fur trading company.

The active agents of the French fur trade were the *Coueurs des Bois*, or rangers of the woods. As a class, they were reckless and improvident. Inured to the hardships of the forest and the wilderness, they soon became attached to a wandering life amidst the woods. The dress of the *Coueurs des Bois* consisted of leggings, mocassins, a capote, or blanket coat, and a red sash twined around them as a girdle, in which was stuck a steel scalping-knife. In this respect they differed little from the native Indians. They departed for the west periodically, by the north-western lakes; and thence, by the forest and streams, to those posts where the Indians were in the habit of resorting, and where were collected the cargoes of furs and peltry, with which they returned to Quebec and Montreal, from which the furs were shipped for France. The goods sent upwards, and the furs brought down made up in packs, were transported in canoes made of birch bark, sufficiently large to convey six men and the goods transported into the interior for barter, and the furs received in exchange. The articles of trade were imported from France, in packages of convenient size. They consisted of cotton cloths, blankets, calicoes, guns, hatchets, and other kinds of hardware, cheap ornaments, and other articles suited to the taste or wants of the Indians. Thus the fur traders, when they reached the Indian territory, either hunted or trapped themselves, or exchanged their goods with the Indians for the furs, which were deposited with the "Farmers of the Beaver Skins," for the purpose of being sent to the markets.

In order to prevent the desertion of the traders from the posts, it was ordained that no person should be permitted to trade with the Indians without passports from the French king, and all persons who had not those licences, were prohibited going from Quebec, or Montreal, to the Indian country *under*

the penalty of death. The ordinary price of these licences, according to La Hontan, was 600 crowns, and they were purchased from the governor-general of Canada by the merchants, and by them sold to the *Coueurs des Bois*, at an advance of about fifteen per cent more than they could command in ready money at Quebec and Montreal. The privileges granted in those licences allowed each possessor to proceed to the ports with two large canoes laden with cargoes of manufactured goods, valued at about 1000 crowns. Each canoe had a crew of six men. On their voyages made through the lakes annually, the ordinary profit was 100 per cent, from which the merchant took 1000 crowns for the prime cost of his exported goods, 600 crowns for his licence, and forty per cent for *bottomry*, so that there remained, from the two cargoes, only 680 crowns, which were divided among the twelve *Coueurs des Bois*. During each year the traders came down the lakes and streams, from the remotest banks of Lake Superior, and then to the Ottawas river, or across the portage of Niagara, with full freights, which were disposed of at Quebec and Montreal.

The evil effects of this exclusive policy soon became manifest, and nearly every person was permitted to embark in the fur trade, and the system of granting licences was abolished. Great improvidence soon pervaded the management of the Canadian fur trade. French manufactures, used in the trade, were of much higher cost than those of the English, and in consequence the profits became so small that many of the French traders absconded to the English posts, which were first established in the country now forming the state of New York.

The Baron La Hontan, who was a resident at Montreal about the year 1685, and who was for some time the French commandant of a fur trading post on the River St. Clair, between Lakes Huron and Erie, in his account of the fur trade, says,—

“ Much about the same day, there arrived at Montreal, twenty-five or thirty canoes belonging to the *Coueurs des Bois*, laden with beaver skins. The cargo of each canoe amounted to forty packs, and will fetch fifty crowns at the farmers’ office. These canoes were followed by fifty more, of the Ottawas and Hurons, who came down every year to the colony, in order to make a better market than they can do in their own country of Michilimackinac, which lies on the banks of the Lake of Hurons (Lake Huron), at the mouth of the Lake of the Illinese (Lake Michigan). Their way of trading is as follows:—Upon their arrival, they encamp at the distance of 500 or 600 paces from the town. The next day is spent in ranging their canoes, unloading their goods, and pitching their tents, which are made of birch bark. The next day they demand an audience of the governor-general, which is granted them that same day in a public place. Upon this occasion each nation makes a ring for itself. The savages sit upon the ground, with their pipes in their mouths, and the governor is seated in an arm-chair; after which, there starts up an orator, or speaker, from one of these nations, who makes an harangue, purporting ‘that his brethren are come to visit the governor-general, and to renew with him their wonted friendship; that their chief view is to promote the interest of the French, some of whom being unacquainted with the way of traffic, and being too weak for the transporting of goods from the lakes, would be unable to deal in beaver skins, if his brethren did not come in person to deal with them in their own colonies; that they know very well how acceptable their arrival is to

the inhabitants of Montreal, from the advantage they reap by it; that, inasmuch as beaver skins are much valued in France, and the French goods given in exchange are of an inconsiderable value, they mean to give the French sufficient proof of their readiness to furnish them with what they desire so earnestly. That by way of preparation for another year's cargo, they are come to take in exchange fusils, powder, and ball, in order to hunt great numbers of beavers, or to gall the Iroquois, in case they offer to disturb the French settlements. And in fine, that in confirmation of their words, they throw a porcelain collar with some beaver skins to the governor-general, whose protection they lay claim to, in case of any robbery or abuse committed upon them in the town.' The spokesman, having made an end of his speech, returns to his place, and takes up his pipe, and the interpreter explains the substance of the harangue to the governor, who commonly gives a very civil answer, especially if the presents be valuable; in consideration of which he likewise makes them a present of some trifling things. This done, the savages rise up and return to their huts, to make suitable preparations for the ensuing trucking.

"The next day the savages make their slaves carry the skins to the houses of the merchants, who bargain with them for such clothes as they want. All the inhabitants of Montreal are allowed to traffic with them, in any commodity but rum and brandy; these two being excepted, upon the account that when the savages have got what they wanted, and have any skins left, they drink to excess, and then kill their slaves, for when they are in drink, they quarrel and fight, and if they were not held by those who are sober, would certainly make havoc one of another. However, you must observe that none of them will touch either gold or silver.

"As soon as the savages have made an end of their trucking, they take leave of the governor, and so return home by the river Ottawas. To conclude, they did a great deal of good both to the poor and rich, for you will readily apprehend that every body turns merchant upon such occasions."

At this early period, a jealousy arose on the part of the French towards the advances of the English fur traders: who, as early as 1686, had penetrated the wildernesses as far as Michilimackinac. In 1720, Charlevoix says, "As for what has been said, that by making a settlement at the Detroit, we should bring the fur trade too much within reach (of the English), there is not a man in Canada who does not agree that we can never succeed in preventing the Indians from carrying them their commodities, let them be settled where they will, and with all the precautions we can possibly take, except by causing them to find the same advantage in trading with us as in the province of New York."

While the French traders were trading among the forests bordering on the great lakes and the Mississippi, and supplying furs to the markets of France, a rival power appeared in Hudson's Bay; which great inlet was first entered by the expedition sent from England, to discover a northern passage between the Atlantic and Pacific. Charles II. granted to a society of London merchants, denominated *The Hudson's Bay Company*, a charter in 1669, upon the implied condition that they would strive to discover a north-west passage. This association confined its trade within the regions of the north, until as a competitor with the French, for nearly a century, the Hudson's Bay Company afterwards extended its trade throughout the greater portion of the north-western territory.

The English fur trade continued to advance through the great chain of the lakes and the region of Hudson's Bay, mingling barbarism and civilisation, until

the power of France was driven from Canada. From the time of the surrender of the French posts in 1760, down to the year 1766, the fur trade from Montreal was in a great measure suspended. The furs which were collected by the Indians from the borders of the lakes, were sold to the traders of Hudson's Bay, who now extended their posts towards the territory which had formerly been occupied by France. In 1766, a few Scotch merchants from Upper Canada, finding the field unoccupied, established a post and factory at Michilimackinac, the central post of the former French fur trade. From this point, their operations soon extended far beyond Lake Superior and the upper waters of the Mississippi, north to Lake Winnipeg, and the Saskatchewan and Lake Athabasca. These traders, on coming in collision with the traders of Hudson's Bay, were for some time harassed, but not expelled by the latter.

Jonathan Carver, an adventurous native of Connecticut, left Boston in 1766, and passing through the Straits of Mackinaw and the upper lakes, passed the two succeeding years in exploring the country west of the Mississippi. His intention was to ascertain the character and acquire the languages of the various Indian tribes which were scattered over those regions, as well as to gain a knowledge of the quality and productions of the soil beyond the Mississippi, and also to discover the breadth of the continent of those regions in its broadest part, from the Atlantic to the Pacific Ocean, between the forty-third and the forty-sixth degree of northern latitude. His ultimate object was to propose to the government the establishment of a post in that region, near the "Strait of Anian," which he considered would facilitate the discovery of a passage between Hudson's Bay and the Pacific. These objects, however, he was not destined to complete; as he was obliged to give up the project just as he had advanced to the river St. Peter's. The journal of his travels was published in London, and widely circulated. It contained interesting information relating to the topography of a country which had then been but partially explored, as well as facts relating to the Indian tribes. It soon led to further adventures.

In 1784, preparations were made by several European nations for the prosecution of the fur trade; especially between the north-western coast of America and China. At this period, the Russians procured the greater part of their furs from the northern parts of their empire, and transported them to China by land; while the markets of Great Britain were supplied by the factories of Canada and Hudson's Bay. China had been long a valuable mart for furs, which were highly prized in the northern parts of the *Celestial Empire*, as a defence against the cold, and throughout its whole extent, as a badge of rank and wealth.

In 1785, James Hanna, an Englishman, sailed from Canton in April, for the prosecution of the fur trade, and, in August, he arrived in Nootka Sound in the first ship that had ever explored the north-west coast of America. Here he exchanged coarse manufactures, and old iron, for a valuable cargo of furs, with

which he returned to the port of Canton. About the same period, an association of merchants termed the "King George's Sound Company," was formed in London for the prosecution of the fur trade on the western coast of America. The scheme of this company was to collect furs on that part of the continent, and to transport them direct to Canton, receiving their return cargo in tea: a special permission having been granted by the East India Company, to carry those teas to London. For this purpose two ships were despatched to the Northern Pacific. In the course of the two following years, two vessels were sent out from Calcutta and Bombay, by the East India Company; from Macao and Canton by the English and Portuguese; and from Ostend under the flag of the Austrian East India Company. The French also, in 1790, despatched expeditions to the north-west coast for the purpose of obtaining information respecting the fur trade. An agent was sent out by Spain to California for the purpose of collecting furs for the market of Canton, in which adventure he appears to have partially succeeded. But the few furs which he had collected were of inferior quality. Meantime the Russians gradually extended their trade on the north-western coast. The American ships *Columbia*, of 220 tons, and the *Lady Washington*, of 90 tons, under the command of Kendrick and Gray, were fitted out by an association of merchants in Boston, and furnished with sea letters from the general government. They sailed together on the 30th of September, 1787, for the prosecution of the fur trade on the same coast.

During the year 1787, the North-west Company of Montreal was established. This association was formed, for the purpose of preventing the fatal collisions which had occurred between individual Canadian traders and those of the Hudson's Bay Company, as well as to re-organise the fur trade on a larger and more secure system. Its members were comprised of the principal merchants of Montreal, who had before been engaged in the fur trade around the lakes. This company did not obtain a charter, but constituted themselves a commercial partnership. It consisted of shares unequally divided among individual stockholders, some of whom were engaged in the importation of goods necessary to carry on the trade, in the supply of capital, and in the exportation of the proceeds; and others who were employed in actual trade at the interior posts and among the Indians. The shares of this company were gradually increased. The agents of the company went annually to Detroit, Mackinaw, St. Mary, and the grand portage, where they received the furs, and forwarded them to Montreal. The articles for the trade consisted of woollen and cotton goods, hardware, cutlery, fire-arms, ammunition, some spirits, and those ornaments and tinsels which were prized by the Indians, as well as in the market of Montreal. These goods were annually shipped from London about the first of May, and in the winter they were bartered for furs and peltry, which during the next autumn were shipped from Canada to London. The food which they used was of a

coarse kind. The partners of the company, the interpreters, clerks, guides, and all in office, were allowed better provisions; but the canoe-men, or *voyageurs*, had generally nothing better than fat melted, or boiled, with Indian corn meal.

The Hudson's Bay Company, which had exercised supreme dominion over the cold regions of the north, soon found a new company advancing over their territory, and the rivalry of the two companies soon gave rise to violent outbreaks, though they confined themselves within different chartered limits. The North-west Company extended its operations over the north-western lakes: their *employés* aided by French Canadians, half-breeds, and Indians, with their commanders or agents, occupied the posts which had formerly belonged to the French along the great lakes and the Mississippi; and in two years after the first establishment of the North-west Company, its advanced posts extended as far as Athabasca lake, 800 miles beyond Lake Superior.

The following table, exhibiting the number of skins, which were collected by this company during one year, is given in the introduction to the *Voyages* of Sir Alexander Mackenzie, a partner in that association:—

PRODUCT of the North-west Company, for one Year previous to 1794.

106,000 beaver skins.	600 wolverine skins.
2,100 bear skins.	1,650 fisher skins.
1,500 fox skins.	100 racoon skins.
4,000 kit fox skins.	3,800 wolf skins.
4,600 otter skins.	700 elk skins.
16,000 musksquash skins.	750 deer skins.
32,000 marten skins.	1,200 dressed deer skins.
1,800 mink skins.	500 buffalo robes.
6,000 lynx skins.	

Fort William, near the grand portage on the north-western shore of Lake Superior, was the port of annual rendezvous, where the partners from the interior met the leading directors from Montreal, to discuss the interests of the trade. The latter ascended the rivers and lakes of the west in large canoes, manned by Canadian voyagers, and provided with articles of traffic as well as of luxury, not excepting the choicest wines. The place of assemblage was the grand council-house, a large wooden building. The antlers of the elk, the bow, and the war club; Indian ornaments of various kinds; richly sculptured pipes wrought from the red stone of that region, or cut from the horns of the deer, and ornamented with the plumes of birds; buffalo robes, and various trophies of Indian hunting and warfare, adorned the walls of the hall. Bear and buffalo skins formed the carpets. At this season a grand dinner was usually provided: consisting of the flesh of deer, buffalo, hares; of various wild fowl; of fish caught in the lakes or streams; and of the luxuries carried from Montreal. The partner of the company; the French *voyageur*, decorated with tinsel, and with a red feather waving in his hat; the half-breed, the highlander, and the

Indian, were all mingled together. On these occasions the forests and rocks echoed the song and the wild music of revelry; and the Indians and traders shared equally in the pleasures, or intemperance, of this annual orgy.

The Russian government was, at the same period, extending its establishments along the western coasts of America. An association was formed by the merchants of Eastern Siberia as early as 1785, for the purpose of carrying on the fur trade upon the northern coasts of the Pacific, under the protection of the Empress Catherine. The government seemed disposed to suppress that company, on account of the cruelty of its agents towards the natives. But the Czar, on the 8th of July, 1799, granted to the association a charter, under the name of the "Russian American Fur Company," giving its shareholders an exclusive right to trade, for twenty years, along a large portion of the coast. This privilege was confirmed by the Emperor Alexander. The directors of this company had their residence in Siberia, at their grand depository for the China trade. This chief office was afterwards changed to St. Petersburg, and was placed under the general control of the imperial department of commerce. The Russian fur trade, although more absolute and military than was that of the French, or than that of the English, was governed by nearly the same general system. At this early period, numerous collisions occurred between the Russian and the United States' fur traders, arising from mercantile rivalry; and, among other charges made, it was complained that fire-arms were furnished to the natives by the Americans. During the year 1791, seven vessels from the United States arrived in the North Pacific, in search of furs; and Captain Ingraham, who sailed from Boston, in 1790, discovered the group which he called the Washington islands.

That celebrated intrepid traveller, Sir Alexander Mackenzie, traversed the continent of America, to the Pacific, in 1793, but England did not then seize upon the advantages which his experience enabled him to describe. The American vessels which traded to the north-west coast for furs, sailed from the United States or from Europe, to the North Pacific, with cargoes of spirits, wine, sugar, tobacco, fire-arms, gunpowder, iron, and coarse manufactures of various kinds, which were exchanged along the sea-coasts with the natives, or Russians, for furs; or return cargoes were obtained by hiring from the Russian agent, hunters and fishermen to procure furs and fish. These cargoes were then shipped to Canton, and bartered for teas, porcelain, nankeen, and silks, which were shipped to the markets of Europe or the United States; or if the American ships were not able to collect a full cargo of furs, they, in its broadest extent, were laden with sandal-wood, pearl-shells, and tortoise-shells, at the Sandwich Islands, for which articles a market and fair prices were found at Canton.

In consequence of the success of the North-west Company of Canada, an

•

American fur trading company was afterwards formed, called, from its principal depôt on the island of Mackinaw, the Mackinaw Company. The North-west and Hudson's Bay Companies traded amidst the regions of the north, and at the head waters of the Missouri; and the Mackinaw Company traded chiefly in canoes to the regions of Iowa and Wisconsin.

By a clause in Mr. Jay's treaty, concluded in 1794, British traders were permitted to enter the American territory, to carry on the fur trade. By the purchase of Louisiana, in 1803, the Americans acquired the splendid advantages of navigating the Mississippi, and all its tributaries, from their sources to the sea. Mr. Jefferson, then president, projected an expedition, to be undertaken by the federal government, for the exploration of the country watered by the Missouri, and westward to the Pacific, which led to the expedition of Lewis and Clarke. Those adventurous travellers proceeded up the Missouri towards the Rocky mountains, partly by land and partly by water, exploring the main stream to its source. Here they prepared to cross the Rocky mountains, in August, 1805, and having accomplished their object, they reached the mouth of the Columbia on the 7th of November, of the same year.

Soon after the return of Lewis and Clarke, the North-west Company of Montreal resolved to extend their fur trade west of the Rocky mountains; and during the spring of 1806, Mr. Silas Frazer, a partner, established a British trading post on Frazer's lake, near the fifty-fourth parallel, at a place since called New Caledonia.

At St. Louis, on the Mississippi, an association was formed, in 1808, called the Missouri Company, which was projected by Manuel Lisa, an enterprising Spaniard. Two years afterwards, a number of trading posts were established upon the Upper Missouri, and one beyond the Rocky mountains, on the Lewis river, by Mr. Henry, and one also on the southern branch of the Columbia. But the enmity of the natives, and the difficulty of obtaining regular supplies of food, obliged Mr. Henry to abandon it in 1810.

The operations of the North-west Company, in confederating the numerous tribes at the west, especially those in the forests around the heads of the Mississippi and the great lakes, induced the American government to send out individual traders, to supply the wants of the Indians, and, if possible, to attract their trade towards the United States. These efforts produced, at the time, but little effect.

Meanwhile, the Russians were extending their establishments upon the North Pacific coasts, as far as Norfolk Sound, and, as early as 1806, they had made preparations to occupy the mouth of the Columbia river. The territory occupied by the Russian Fur Company was divided into districts, and each district was placed under a commandant, aided by a number of Russians, who kept the

natives under entire subjection, and compelled them to labour for them. These petty commandants were under the general direction of superior commanders: one of whom resided in each group of settlements; and all were subject to the will of a chief director, or governor-general, who exercised absolute power over them, subject to certain written regulations which were drawn up at St. Petersburg. The labourers in the Russian fur trade were employed principally as mechanics, hunters, fishermen, or soldiers, and consisted chiefly of vagabond Russians. The furs collected by them were shipped to Petro-Pawlowsk and Ochotsk, to which places the goods also required for the trade were brought partly from Russia, and partly by American vessels. The Russian government afterwards nearly excluded the American vessels from the coast, in order that the Russian company might monopolise not only the fur trade, but prevent the Americans from furnishing the Indians with arms and ammunition.

In 1800, the stock of the Russian Fur Company rose to an enormous price, or value, under Alexander Baranoff, whom the Americans describe as a bold, shrewd, energetic, and heartless man; who, in weighing the interests of the fur and fishing trade, considered the profits as of far greater consequence than right and humanity.

Mr. John Jacob Astor, a German, who had emigrated from his native country in 1783, engaged individually in the American fur trade, and realised a splendid fortune. He obtained, in 1809, a charter from the legislature of New York, for organising a Pacific Fur Company: *all the capital of which belonged to himself*. His plan was to establish posts on the coast of the Pacific, on the Columbia, and on its branches, as well as on the head waters of the Missouri. These posts were to be supplied with all necessary articles for trade, either by way of the Missouri, or from the principal factory at the mouth of the Columbia: which post was to be supplied by ships, that were to sail annually from the port of New York. This principal depôt was to be the magazine for all the furs and peltries collected at the other posts, and the ships, after discharging their outward cargoes, were to be laden with furs, to be exported to Canton, and to receive there in return, teas, silks, and other Chinese productions, which were to be carried to New York. It was also proposed to supply by the American ships, the Russians on the north-west coast, with any goods they might require, for which furs were to be received in exchange; and for that object a special agent was sent to St. Petersburg, who succeeded in effecting a negotiation for carrying the project into effect. Mr. Astor received strong assurances, from the cabinet of Mr. Jefferson, of support to the enterprise.

For the prosecution of this grand project two expeditions were fitted out: one by sea and one by land. The former was directed to proceed by sea from New York to the mouth of the Columbia, with the proper stores, arms, and

ammunition, for the establishment of a fortified post at the mouth of the Columbia; and the other to advance by land, up the Missouri, and across the Rocky mountains to the same point, marking on their way the most suitable places for the establishment of the interior posts.

For the execution of his plan Mr. Astor engaged, as partners, a number of Scotchmen who had been employed in the North-west Company, together with Americans and Canadians, acquainted with the fur trade. Those partners were empowered to conduct the trade in the north-west: receiving for their services one-half of the profits, while Mr. Astor, who was to remain in New York and superintend its general operations, and furnish the capital, was to retain the other half. In 1809, the ship *Enterprise* was despatched to the North Pacific, to obtain information at the Russian settlements, and to prepare the way for future operations.

In September, 1810, the ship *Tonquin* left New York, laden with the supplies for the establishment of the post at the mouth of the Columbia, and arrived there in March of 1811. A site was selected on that river about eight miles from the ocean, and named *Astoria*. The goods of the *Tonquin* were landed, and she sailed to the North Pacific in search of furs. During the following summer, the necessary buildings were erected; a garden was commenced; a small vessel was built; and trade was begun with the natives.

In July following, a detachment from the North-west Company arrived at Astoria, under the direction of Mr. Thompson, who left Montreal during the preceding year for the purpose of taking possession of the mouth of the Columbia. On their way to that point they erected huts and raised flags, under the conviction that it was the territory of their sovereign; but found the most important point occupied by the settlement of Astoria. The expedition was, however, treated with hospitality by McDougall, Mackay, and Stuart, the agents of the Pacific Fur Company.

The American land party under Mr. Hunt ascended the Missouri, crossed the Rocky mountains and arrived at Astoria in the spring of 1812. They suffered extraordinary hardships on their route; and had scarcely reached Astoria when news arrived of the destruction of the *Tonquin* and her whole crew, with the exception of the Indian interpreter. It appears that near Nootka Sound the crew was overpowered by the natives, with the exception of the clerk, and a few others, who took refuge in the hold, and by whom the ship was blown up. This catastrophe arrested the trade of the settlement, which was temporally revived in May, 1812, by the arrival of the *Beaver*, with supplies from New York.

In January, 1813, information of the war between the United States and Great Britain reached Astoria, and in the June following, Mr. McTavish, a

partner in the North-west Company, arrived, and communicated to McDougall and Ross Cox, the managers, that a British naval force was approaching to take possession of the mouth of the Columbia. McDougall, and Ross Cox, immediately quitted the service of the American company; entered into that of the rival association; and the traders unanimously agreed, that if succour did not soon arrive, they would relinquish the post. About the same time, a body of men in the service of the North-west Company, brought information that a large armed ship, called the *Isaac Todd*, had been fitted out at London by the North-west Company, and was approaching the Columbia under the convoy of a frigate, with directions to destroy every thing that was American. McTavish and Stewart, who led the North-west detachment, purchased the whole of the stock of the Pacific company within the territory of Columbia, and engaged in their service all the traders employed by the Americans. A transfer of all the property was accordingly made to the North-west Company for 40,000 dollars, paid in bills on Montreal. While the transfer was in progress, a British ship of war hove in sight, anticipating a valuable booty from the capture of Astoria, which was still surmounted by the American flag. The place was surrendered by McDougall, the chief agent; but the property was then safely on its way up the Columbia, in the barges of the North-west Company. The American flag was replaced by that of England, and the name of the post changed to Fort George. On the 28th of February, 1814, Mr. Hunt arrived at the Columbia in the brig *Pedlar*, which had been chartered for the purpose of transporting the property of the American company to Canton; but he found the post in possession of McDougall, acting as a partner of the North-west Company, and having the chief direction of Fort George, as a British post. Mr. Hunt received the bills which were given for the company's effects at Astoria, and its establishments, and sailed to the United States by way of Canton.

By the treaty of Ghent between Great Britain and the United States, it was provided that all posts taken during the war should be restored, and in accordance with this clause, the Americans, in 1814, demanded the restitution of Astoria, as one of those posts. On the 4th of October, 1817, the sloop of war, *Ontario*, under the command of Captain Biddle, sailed from New York for the Pacific, in order to take possession of the post, which was given up to the commissioner, Mr. Prevost, in October, 1818. During the following year, the charter of the Russian Fur Company, which had been granted by the Emperor Paul, was renewed for twenty years by the Emperor Alexander; and on the 4th of September, 1821, an imperial *ukase* or edict was issued, in which pretensions were advanced claiming a great extent of the north-western coast of America, by right of discovery and possession: which claim, however, was not admitted by either England or America.

The rivalry of the North-west and Hudson's Bay companies, which had long involved their factors and traders in skirmishing hostility, assumed, in 1814, the character of actual war. A colony of Scotch Highlanders, established on the banks of the Red river, by Lord Selkirk, in virtue of a grant by the Hudson's Bay Company, was surprised by the North-west Company, who denied the validity of that grant; and whose posts had been supplied from the Red river lands. Numerous acts of violence ensued, and in 1814, the Scotchmen were driven away, their houses demolished, and the colony destroyed. The settlement was re-established during the following year, when hostilities were renewed, and the posts retaken and burned. On the 19th of June, 1816, a battle was fought between the rival traders, Lord Selkirk's Highland settlers were routed, and their governor, Mr. Temple, and several others, were killed. In consequence of these fatalities, and of arrangements made in 1819 and 1820, the two companies were united by the name of "*The Hudson's Bay Company*," under a charter granting to them the privilege of trading in the Indian territory claimed or belonging to Great Britain, for the period of twenty-one years. The duration of this charter was, in 1838, renewed to 1859.

Expeditions to the country west of the Rocky mountains were afterwards made, from the United States by Ashley, Bonneville, Wyeth, Parker, and others. In 1826, Messrs. Smith, Jackson, and Sublette, of St. Louis, formed a company, called the Rocky Mountain Fur Company, and purchased the establishment and interests belonging to General Ashley, of Missouri, who had previously made an expedition beyond the mountains, aided by sixty men, with a cannon drawn by mules. In 1832, Captain Bonneville, of the American army, led a band of more than a hundred men, with mules and pack-horses, transporting goods from Missouri, and collecting furs, chiefly in the country drained by the Lewis river and its branches. About the same time, Mr. Nathaniel Wyeth projected an enterprise for the prosecution of the fur trade between the ports of the United States and the Columbia; and, although he was obliged to relinquish his expedition on account of the indirect opposition of the Hudson's Bay Company, his explorations were of great service, by furnishing information respecting the country. The recent journal of Parker, contains much information respecting the Oregon region.

HUDSON'S BAY COMPANY.—The affairs of this company are managed by a governor, a deputy-governor, and a committee of directors, established in London, and by whom its operations are planned, and to whom the reports of its affairs are transmitted. The trade of the company in America, is directed by a resident governor, agents, factors, and clerks, some of whom have a share of the profits of the trade; and also by a more active class of agents, the hunters, voyagers, and trappers, consisting of Scotch Highlanders, French Canadians, half-breeds,

and Indians, who are paid a small salary, with promises of future advancement according as they shall render themselves of value to the trade. The furs which are collected are procured mainly from the Indians, in exchange for manufactured goods, which are imported into the country; the servants of the company are also engaged, at particular seasons, in hunting and trapping. The territory ranged by this company is divided into districts, each of which is under the charge of an agent, who receives the goods imported from England, and distributes them to the traders, receiving in return the furs which are collected by them. These furs are sent to three chief depôts—Montreal, in Canada; York factory, on Hudson's Bay; and Fort Vancouver, upon the Columbia river. Each of these chief posts is the centre of a number of inferior posts. The goods from Montreal generally pass through Fort William, on the north-west shore of Lake Superior. Several vessels, and also a steamboat, are employed by the company upon the north-west coast. Goods for the trade are imported to Fort Vancouver direct from London, and the furs collected at that post are annually shipped to the British metropolis. The rivers and inlets of the regions under the company's charter west of the Rocky mountains swarm with salmon, and other varieties of fish. The Hudson's Bay Company has a trading post at the Sandwich Islands, and has also rented some of the posts belong to the Russian company.

The value of furs collected in 1828, according to returns made, was about 200,000*l*. The shares of the corporation had increased from forty per cent below par, to 140 per cent above par. The annual value of the peltries exported from America by the Hudson's Bay Company between 1827 and 1833, exceeded 200,000*l*. Mr. Wyeth estimated the value of furs collected in the territories west of the Rocky mountains, by the company, at 138,000 dollars, for which were only paid about 20,000 dollars' worth of goods at the prime cost, the services of 350 men, and two years' interest on the investment.

EXPORTS in 1831.

The North American Fur Company have but few posts on the west side of

the Rocky mountains. Its agents procure nearly all their furs themselves, by trapping; and trade but little with the Indians. Three or four hundred hunters and trappers remain in that country, who repair during each summer to the places of rendezvous, carrying their furs on their backs, or on pack-horses, where they meet the caravans from the United States. The principal places of rendezvous for the American traders are on Green river, a branch of the Colorado, at the foot of the Rocky mountains, and at Pierre's Hole. A portion of the American fur traders are also stationed round the great lakes, at the posts formerly occupied by the old French and English companies; and a large quantity of fish is taken by them annually in the waters of Lake Superior, which are shipped, together with the furs collected, to New York. The quantity of furs collected annually by the American Fur Company, we are not able to state; but it must be great, from the quantity exported, exclusive of the home consumption.

The success of the Rocky Mountain Fur Company, which had advanced into the west, soon excited the emulation of the American Fur Company; Mr. Astor, its founder, having retired in consequence of his age, the concerns of the company were left under the direction of Mr. Ramsay Crooks. A competition soon sprang up between the two companies, for the trade with the mountain tribes, upon the head waters of the Columbia, and other tributaries of the Pacific.

The character of the men engaged as hunters and trappers in the fur trade throughout the extreme north-west, is peculiar. The trade is not carried on now, as in former times, by batteaux and canoes, under the old French and English system. The fur animals have disappeared before the advance of settlers along the shores of the lakes and rivers; and the great bulk of the fur trade has been transferred to the mountain regions. The traders transport their goods, or furs, upon pack-horses, or carry them on their own backs. They move from place to place on horseback, sometimes conveying their traps upon their shoulders through deep ravines, or up steep precipices. The life of the trapper is therefore a course of toil, deprivation, and excitement.

Fort Vancouver, belonging to the Hudson's Bay Company, is situated on the Columbia, about 100 miles from its mouth. It is comprised in a group of buildings enclosed by pickets, which includes a space of about 450 feet. Here there are thirty-four houses, and also workshops for mechanics, and a fort. Near the fort are cabins for labourers, and the connecting buildings, a saw-mill, magazine hospital, and a large boat-house near the shore. At this point is also a farm containing 3000 acres of land, cultivated by Canadians and half-breed Iroquois. Four ships ply from the coast, bringing supplies, and returning with furs to London. A steamboat called the *Beaver*, of 150 tons, and with two engines of

thirty horse power, built in London, is employed in navigating the straits from Juan de Fuca to Stickern.

The fur trade has long extended adventure, employment, and excitement to vast numbers; but it appears fated to decline, with the destruction of wild animals, east as well as west of the Rocky mountains. The indiscriminate destruction of those animals, has been obviated in some measure by the Hudson's Bay Company, who have preserved particular tracts. The Russians and the Hudson's Bay Company exclude American vessels from the north-west Pacific coast. The American fur trade, which now ranges west of Lake Superior and the Missouri, towards the Rocky mountains, has changed its principal depôt from Detroit to St. Louis. A writer in the *New York Merchants' Magazine* observes:—

“An interesting feature of the commerce of St. Louis, is the circumstance that the trade of the American Fur Company, and that of other independent traders, including the fur trade of nearly all the northern and north-western Indians within the jurisdiction of the United States, concentrates at that point. The value, to that city, of the trade in cloths, blankets, and other fabrics used in the traffic, exclusive of annuities, the pay of hands, and the outfits for expeditions, boats, &c., has been estimated, by individuals familiar with the trade, as exceeding 225,000 dollars. It has been computed that the exportation of furs, buffalo-robcs, and peltries, the proceeds of that trade, which go to the Atlantic cities, independently of the home consumption, and the amount sent to the Ohio and other parts of the west, during the year 1841, was between 350,000 dollars and 400,000 dollars; and that the entire fur trade for that year could not fall short of 500,000 dollars. This trade includes the furs and skins that were collected by the various Indian tribes from the Mississippi to the Pacific, and from the Columbia to the California. The American Fur Company, it is well known, was originally incorporated with a capital of 1,000,000 dollars; and into this, as well as the Messrs. Brent's company upon the Arkansas, have been merged several smaller companies. They employ a number of steam and other boats, and several thousands of men. These boats, at least once a year, ascend the Missouri to the mouth of the Yellowstone, freighted exclusively with supplies for trade in furs with the several Indian tribes between the state line and that river, and also with the tribes extending thence to the Rocky mountains and the Pacific. The furs and peltries thus collected through that extensive tract of territory, as well as those purchased by the Mexicans, traverse a considerable portion of the Mississippi and the interior rivers; but the trade has, as is well known, become diverted to other channels, and has suffered substantial drawbacks in consequence of a want of certainty in the plans upon which it has been prosecuted.”

The trade in the skins of wild animals being carried on in every market in Europe, Asia, Africa, and America, and as those animals, whose furs are considered the most valuable, as objects more of luxury than of necessity, are in all countries decreasing in numbers,—the fashion, or taste, for furs must either diminish in proportion, or the price must advance in the same ratio, as the furs most sought for become rarer.

The following tables are compressed from official returns:—

CHAPTER XX.

AMERICAN TRADE OVER THE PRAIRIES, AND WITH SANTA FE.

THE account given by Mr. Gregg, recently published, of this adventurous branch of commerce is remarkably interesting. From this account and some statements, compiled by Mr. Hunt, in the *Merchants' Magazine*, we have drawn up the following statement. Mr. Gregg observes,

"A tour on the prairies is certainly a dangerous experiment for him who would live a quiet contented life among his friends and relations at home; not so dangerous to life or health, as prejudicial to his domestic habits. Those who live pent up in our large cities, know but little of the broad, unembarrassed freedom of the great western prairies. Viewing them from a snug fireside, they seem crowded with dangers, labours, and sufferings; but once upon them, and these appear to vanish and are soon forgotten."

His pages are enthusiastic on prairie life, and abound with predilections for the mustang and the buffalo, the little prairie dogs, wild colts, and still wilder, Indians. He has repeated his journeys to New Mexico eight times; and observes,

"The overland trade between the United States and the northern provinces of Mexico, seems to have had no very definite origin; having been rather the result of accident than of any organised plan of commercial establishment. For a number of years its importance attracted no attention whatever. From Captain Pike's narrative, we learn, that one James Pursley, after much wandering over the wild and then unexplored regions west of the Mississippi, finally fell in with some Indians on the Platte river, near its source in the Rocky

mountains; and obtaining information from them respecting the settlements of New Mexico, he set out in company with a party of these savages, and descended, in 1805, to Santa Fé, where he remained for several years—perhaps till his death. It does not appear, however, that he took with him any considerable amount of merchandise.

“Although Captain Pike speaks of Pursley as the first American that ever crossed the desert plains into the Spanish provinces, it is nevertheless related by the same writer, that, in consequence of information obtained by the trappers, through the Indians, relative to this isolated province, a merchant of Kaskaskia, named Morrison, had already despatched, as early as 1804, a French Creole, by the name of La Lande, up Platte river, with directions to push his way into Santa Fé, if the passage was at all practicable. This emissary was perfectly successful in his enterprise; but the kind and generous treatment of the natives overcame at once his patriotism and his probity. He neither returned to his employer, nor accounted for the proceeds of his adventure. His expansive intellect readily conceived the advantages of setting up in business for himself upon this ‘borrowed’ capital; which he accordingly did, and remained there, not only unmolested, but honoured and esteemed till his death, which occurred some fifteen or twenty years afterward—leaving a large family, and sufficient property to entitle him to the fame of *rico* among his neighbours.”

Mr. Gregg should have added, and of *rogue*, amongst honest men.

The Santa Fé trade appears to have attracted very little notice until the return of Captain Pike. In 1812, an expedition was fitted out under the auspices of Mac Knight, Beard, Chambers, and several others, who followed the directions of Captain Pike across the western wilds to Santa Fé. They considered that the declaration of independence by Hidalgo, in 1810, had completely removed the injurious restrictions upon all foreign intercourse, except by special permission from the Spanish government. Hidalgo had some time before been arrested and executed, the royalists had regained the ascendancy, and all foreigners, particularly Americans, were now viewed with suspicion. Mac Knight and his associates were, immediately on their arrival, seized as spies, their goods confiscated, and the leaders were shut up in the *calabozos* of Chihuahua, where most of them were imprisoned for nine years, when Iturbide set them at liberty. Two of the party are said to have, in 1821, returned to the United States over the mountains and prairies, and, by a canoe down the Canadian branch of the Arkansas. The reports which they promulgated induced a merchant of Ohio, named Glenn, who, at the time, had an Indian trading-house near the mouth of the Verdigris river, to embark in the Santa Fé trade. He proceeded up the Arkansas towards the mountains, and encountered great labour and privation, but reached Santa Fé in safety, with his caravan, at the end of 1821.

During the same year, Captain Becknell, of Missouri, with four companions, went out to Santa Fé by the western prairie route. They started from the vicinity of Franklin, for the purpose of trading with the Comanche Indians; but having met accidentally a party of Mexican rangers, near the mountains, the former were prevailed upon to accompany the latter to Santa Fé, where they realised for their small stock of goods, a large profit. Up to this date New Mexico had received all her supplies from the internal provinces by the way of Vera Cruz;

but at such exorbitant rates, that common calicoes, and even bleached and brown domestic goods, sold as high as two to three dollars per *vara* (or Spanish yard of thirty-three inches).

The favourable reports brought by Becknell, stimulated others; and early in May following, Colonel Cooper, from the same neighbourhood, accompanied by several others, set out with 4000 to 5000 dollars' worth of goods, which they transported upon pack-horses. They proceeded to Taos, where they arrived safely with their goods.

Captain Becknell, with about thirty men, and 5000 dollars' worth of goods, started from Missouri, about a month after Colonel Cooper. Being an excellent woodsman, and anxious to avoid the circuitous route of the Upper Arkansas country, he resolved on reaching the "Caches," on that river, to proceed more directly for Santa Fé.

Ignorant of the arid plains, they pursued their course without being able to procure any water. The scanty supply which they carried in their canteens was completely exhausted after two days' march, and the sufferings of both men and horses afterwards reduced them to the necessity of killing their dogs, and cutting off the ears of their mules, in order to assuage their thirst with the blood. In despair, they scattered in every direction in search of water, but without success.

Mr. Gregg says that,

"Frequently led astray by the deceptive glimmer of the mirage, or false ponds, as those treacherous oases of the desert are called, and not suspecting (as was really the case) that they had already arrived near the banks of the Cimarron, they resolved to retrace their steps to the Arkansas. But they now were no longer equal to the task, and would undoubtedly have perished in those arid regions, had not a buffalo, fresh from the river's side, and with a stomach distended with water, been discovered by some of the party, just as the last rays of hope were receding from their vision. The hapless intruder was immediately despatched, and an invigorating draught procured from its stomach. I have since heard one of the parties to that expedition declare, that nothing ever passed his lips which gave him such exquisite delight as his first draught of that filthy beverage.

"This providential relief enabled some of the strongest men of the party to reach the river, where they filled their canteens, and then hurried back to the assistance of their comrades, many of whom they found prostrate on the ground, and incapable of further exertion. By degrees, however, they were all enabled to resume their journey; and following the course of the Arkansas for several days, thereby avoiding the arid regions which had occasioned them so much suffering, they succeeded in reaching Taos (sixty or seventy miles north of Santa Fé), without further difficulty."

It is from this period (1822) that the established commencement of the Santa Fé trade may be dated. In 1824, a company of traders, about eighty in number, among whom were several men of intelligence from Missouri, employed pack-mules, and twenty-five wheeled vehicles, of which two were stout road-waggon, two carts, and the rest Dearborn carriages; the whole conveying from 25,000 to 30,000 dollars' worth of merchandise. The caravan reached Santa Fé with much less difficulty than was anticipated from a first experiment with wheeled vehicles.

The early traders seldom experienced any molestation from the Indians, and generally crossed the plains in detached bands, each individual rarely carrying more than 200 or 300 dollars' worth of stock. This peaceful trade did not last long; and the traders are said not to have been innocent of having instigated the hostilities of the natives.

Since the commencement of the Santa Fé trade, returning parties have performed the homeward journey across the plains with the proceeds of their enterprise, partly in specie, and partly in furs, buffalo rugs, and animals.

"The fall of 1828," says Mr. Gregg, "proved still more fatal to the traders on their homeward trip; for by this time the Indians had learned to form a correct estimate of the stock with which the return companies were generally provided. Two young men, named McNees and Monroe, having carelessly laid down to sleep on the banks of a stream, since known as McNees' creek, were barbarously shot, with their own guns, as it was supposed, in the very sight of the caravan. When their comrades came up, they found McNees lifeless, and the other almost expiring. In this state the latter was carried nearly forty miles to the Cimarron river, where he died, and was buried according to the custom of the prairies.*

"Just as the funeral ceremonies were about to be concluded, six or seven Indians appeared on the opposite side of the Cimarron. Some of the party proposed inviting them to a parley, while the rest, burning for revenge, evinced a desire to fire upon them at once. It is more than probable, however, that the Indians were not only innocent but ignorant of the outrage that had been committed, or they would hardly have ventured to approach the caravan. Being quick of perception, they very soon saw the belligerent attitude assumed by some of the company, and therefore wheeled round and attempted to escape. One shot was fired, which wounded a horse and brought the Indian to the ground, when he was instantly riddled with balls! Almost simultaneously another discharge of several guns followed, by which all the rest were either killed or mortally wounded, except one, who escaped to bear to his tribe the news of their dreadful catastrophe!

"These wanton cruelties had a most disastrous effect upon the prospects of the trade; for the exasperated children of the desert became more and more hostile to the 'pale faces,' against whom they continued to wage a cruel war for many successive years. In fact, this same party suffered very severely a few days afterwards. They were pursued by the enraged comrades of the slain savages to the Arkansas river, where they were robbed of nearly a thousand head of mules and horses. But the Indians were not yet satisfied. Having beset a company of about twenty men, who followed shortly after—they killed one of their number, and subsequently took from them all the animals they had in their possession. The unfortunate band were now not only compelled to advance on foot, but were even constrained to carry nearly 1000 dollars each upon their backs to the Arkansas river, where it was concealed in the ground, till a conveyance was procured to transfer it to the United States.

"Such repeated and daring outrages induced the traders to petition the federal government for an escort of United States troops. The request having been granted, Major Riley, with three companies of infantry and one of riflemen, was ordered to accompany the caravan, which left in the spring of 1829, as far as Chouteau's Island on the Arkansas river. Here the escort stopped, and the traders pursued their journey through the sand-hills beyond. They had hardly advanced six or seven miles, when a startling incident occurred, which made them wish once more for the company of the gallant major and his well-disciplined troops. A vanguard of three men, riding a few hundred yards ahead, had

* These funerals are usually performed in a very summary manner. A grave is dug in a convenient spot, and the corpse, with no other shroud than its own clothes, and only a blanket for a coffin, is consigned to the earth. The grave is then usually filled up with stones or poles, as a safeguard against the voracious wolves of the prairies.

just dismounted for the purpose of satisfying their thirst, when a band of Kiawas, one of the most savage tribes that infest the western prairies, rushed upon them from the immense hillocks of sand which lay scattered in all directions. The three men sprang upon their animals, but two only, who had horses, were enabled to make their escape to the waggons; the third, a Mr. Lamme, who was unfortunately mounted upon a mule, was overtaken, slain, and scalped before any one could come to his assistance. Somewhat alarmed at the boldness of the Indians, the traders despatched an express to Major Riley, who immediately ordered his tents to be struck; and such was the rapidity of his movements, that when he appeared before the anxious caravan, every one was lost in astonishment. The reinforcement having arrived in the night, the enemy could have obtained no knowledge of the fact, and would no doubt have renewed the attack in the morning, when they would have received a wholesome lesson from the troops, had not the *reveille* been sounded through mistake, at which they precipitately retreated. The escort now continued with the company as far as Sand creek, when, perceiving no further signs of danger, they returned to the Arkansas, to await the return of the caravan in the ensuing fall.

"The position of Major Riley, on the Arkansas, was one of serious and continual danger. Scarce a day passed without his being subjected to some new annoyance from predatory Indians. The latter appeared, indeed, resolved to check all further intercourse of the whites upon the prairies; and fearful of the terrible extremes to which their excesses might be carried, the traders continued to unite in single caravans during many years afterwards, for the sake of mutual protection. This escort under Major Riley, and one composed of about sixty dragoons, commanded by Captain Wharton, in 1834, constituted the only government protection ever afforded to the Santa Fé trade, until 1843, when large escorts, under Captain Cook, accompanied two different caravans as far as the Arkansas river."

The established post, or *entrepôt*, for depositing the goods brought on the voyage upwards by the Missouri, for the Santa Fé trade, is the town of Independence, situate about twelve miles from the Indian border, and two or three south of the Missouri river. The caravans generally start in the month of May. The ordinary supplies for each person are usually as follows: about fifty pounds of flour, as many of bacon, ten of coffee, and twenty of sugar, with a little salt, biscuits, beans, &c.; the plentiful herds of buffalo to be met with throughout the journey, affording an ample supply of fresh meat. The waggons are drawn by eight mules, or oxen, the former being now generally preferred, on many accounts, to horses, except when occasionally used for hunting in the chase. Oxen have been found to retain their strength far longer than the mules in these expeditions, especially when they had to pass through muddy or sandy places, yet they fail when the grass becomes drier and shorter, and, on this account, mules have been more generally employed.

"It is usual for the traders at first to move off in detached parties, till they reach Council Grove, about ten days' journey, the rendezvous where they become organised into a general body or *caravan*, for their mutual defence and security during the remainder of their journey. Travellers suffer more loss and annoyance from the straying of cattle during the first 100 miles, from the neglect in properly looking after them, than at any subsequent period; the frequent surprisals of the Indians rendering greater vigilance, in this respect, afterwards indispensably necessary. After leaving Council Grove, not a single human habitation—not even an Indian wigwam, it seems, greets the vision of the prairie adventurer."

The name given to this spot is stated by Mr. Gregg to have resulted from the stipulated payment of some 800 dollars, in merchandise, having been paid

to some bands of the Osages, in 1825, by the United States commissioners, Reeves, Sibley, and Mathas, for insuring the suspension of hostile invasion of these wild "sons of the soil" upon the traders in Santa Fé.

"Having entered the name of every member of the company, with the number of waggons, &c., and elected a captain for the command, with a lieutenant to its several divisions—a precaution essentially requisite, as these expeditions frequently number 100 waggons, and a corresponding complement of men with their rifles, including some small mounted cannons, they proceed upon their travels."

They meet with buffalo and Indian in about the same latitude; "but their welcome for the former is far more enthusiastic and sincere, for their stomachs' sake, than the latter, dauntless as they sometimes show themselves on the approach of the 'ferocious foe.'" After a few encounters with the Indians, the party were surprised by the appearance of the grizzly bear, about which such exaggerated stories have been given by travellers.

Mr. Gregg alludes more than once to those singular animals, the prairie-dog, and their habits of colonisation. The prairie-dog bears some affinity with the marmot: especially so in their torpidity during winter. A collection of their burrows, in some cases extending over an area of several square miles, and amounting to some thousands in the same vicinity, has been not inaptly termed by travellers "a dog-town." They seem to be remarkably social and domestic in their habits.

Mr. Gregg prepared the following table of the value of merchandise invested in the Santa Fé trade, from 1822 to 1843 inclusive; and the portion of the same transferred to the southern markets (chiefly Chihuahua) during the same period; together with the approximate number of waggons, men, and proprietors engaged each year. The table is not given as perfectly accurate, yet he believed it to be about as nearly so as any that could be made out at the present day. The column marked "Proprietors" presents the whole number engaged each year. He observes that,—

"At first, almost every individual of each caravan was a proprietor, while of late the capital has been held by comparatively few hands. In 1843, the greater portion of the traders were New Mexicans, several of whom, during the three years previous, had embarked in this trade, of which they bid fair to secure a monopoly. The amount of merchandise transported to Santa Fé each year, is set down at its probable cost in the eastern cities of the United States. Besides freights and insurance to Independence, there has been an annual investment, averaging nearly twenty-five per cent upon the cost of the stocks, in waggons, teams, provisions, hire of hands, &c., for transportation across the prairies. A large portion of this remaining unconsumed, however, the ultimate loss on the profit has not been more than half of the above amount. Instead of purchasing outfit, some traders prefer employing freighters, a number of whom are usually to be found on the frontier of the Missouri, ready to transport goods to Santa Fé, at ten to twelve cents per pound. From thence to Chihuahua the price of freights is six to eight cents, upon mules, or in waggons. The average gross returns of the traders has rarely exceeded fifty per cent upon the cost of their merchandize, leaving a net profit of between twenty and forty per cent; though their profits have not unfrequently been under ten per cent; in fact, as has before been mentioned, their adventures have sometimes been losing speculations.

YEARS.	Amount of Merchandise.	Waggons.	Men.	Proprietors.	Taken to Chi- huahua.	REMARKS.
	dollars.	number.	number.	number.	dollars.	
1822.....	15,000		70	60		Pack animals only used.
1823.....	12,000		50	30		Ditto, ditto.
1824.....	35,000	26	100	60	3,000	Ditto, and waggons.
1825.....	65,000	37	130	98	5,000	Ditto, ditto.
1826.....	90,000	60	100	74	7,000	Waggons only, henceforth.
1827.....	85,000	55	90	50	8,000	
1828.....	150,000	100	200	80	20,000	3 men killed—(the first).
1829.....	60,000	30	50	20	5,000	1st U. S. Escort, 1 trader killed.
1830.....	120,000	70	140	60	20,000	First oxen used by traders.
1831.....	250,000	130	320	80	80,000	Two men killed.
1832.....	140,000	70	185	60	50,000	Party defended on Canadian, 2
1833.....	180,000	105	160	50	80,000	men killed, 3 perished.
1834.....	150,000	80	140	40	70,000	2nd U. S. Escort.
1835.....	140,000	75	145	35	60,000	
1836.....	130,000	70	160	35	80,000	
1837.....	140,000	80	100	20	40,000	
1838.....	90,000	50	250	40	100,000	Arkansas expedition.
1839.....	260,000	130	60	5	10,000	Chihuahua ditto.
1840.....	50,000	30	100	12	80,000	Texas Santa Fé expedition.
1841.....	150,000	60	120	15	90,000	
1842.....	100,000	70	350	30	300,000	3rd U. S. Escort, ports closed.
1843.....	450,000	230				

"From 1831 to the present date, prices have scarcely averaged, for medium calicoes, thirty-seven cents, and for plain domestic cottons, thirty-one cents per yard. Taking assortments round, 100 per cent upon United States costs were generally considered excellent sales: many stocks have been sold at a still lower rate. The average prices of Chihuahua are equally low, yet a brisker demand has rendered this the most agreeable and profitable branch of the trade.

"The first attempt to introduce American goods into the more southern markets of Mexico from Santa Fé, was made in the year 1824. The amounts were very small, however, till towards the year 1831. For a few of the first years, the traders were in the habit of conveying small lots to Sonora and California; but this branch of the trade has, I believe, latterly ceased altogether. Yet the amounts transferred to Chihuahua have generally increased; so that for the last few years, that trade has consumed very nearly half of the entire imports by the Missouri caravans.

"The entire consumption of foreign goods in the department of Chihuahua, has been estimated, by intelligent Mexican merchants, at from two to three millions annually; the first cost of which might be set down at nearly one half. Of this amount the Santa Fé trade, as will be seen from the accompanying table, has not furnished a tenth part; the balance being introduced through other ports, viz.: Matamoros, whence Chihuahua has received nearly half its supplies—Vera Cruz, via the city of Mexico, whence considerable amounts have been brought to this department—Tampico, on the Gulf of Mexico, and Mazatlan, on the Pacific, via Durango, whence the imports have been of some importance—while nearly all the west of the department, and especially the heavy consumption of the mining town of Jesus-Maria, receives most of its supplies from the port of Guaymas on the Gulf of California; whence, indeed, several stocks of goods have been introduced as far as the city of Chihuahua itself. In 1840, a large amount of merchandise was transported directly from the Red river frontier of Arkansas to Chihuahua; but no other expedition has ever been made in that direction.

"By far the greatest portion of the importations through the seaports, has been made by British merchants. It is chiefly the preference given to American manufactures, which has enabled the merchandise of the Santa Fé adventurers to compete in the southern markets, with goods introduced through the seaports, which have had the benefit of the drawback. In this last respect our traders have laboured under a very unjust burden.

"It is difficult to conceive any equitable reason why merchants, conveying their goods across the prairies in waggons, should not be as much entitled to the protection of the government, as those who transport them in vessels across the ocean. This assistance might have enabled our merchants to monopolise the rich trade of Chihuahua; and they

would, no doubt, have obtained a share of that of the still richer departments of Durango and Zacatecas, as well as some portion of the Sonora and California trade. Then rating that of Chihuahua at 2,000,000, half that of Durango at the same, and 1,000,000 from Zacatecas, Sonora, &c., it would ascend to the amount of some 5,000,000 of dollars per annum.

"In point of revenue, Santa Fé has been of but little importance to the government of Mexico. Though the amount of duties collected annually at this port has usually been 50,000 to 80,000 dollars, yet nearly one-half has been embezzled by the officers of the customs, leaving an average net revenue of perhaps less than 40,000 dollars per annum.

"It is not an unimportant fact to be known, that, since the year 1831, few or none of the difficulties and dangers which once environed the Santa Fé adventurer have been encountered. No traders have been killed by the savages on the regular route, and but few animals stolen from the caravans. On the whole, the rates of insurance upon adventures in this trade should hardly be as high as upon marine adventures between New York and Liverpool. While I declare, however, the serious dangers and troubles to have been in general so slight, I ought not to suppress at least an outline of the difficulties that occurred on the prairies in 1843, which were attended with very serious consequences.

"It had been reported in Santa Fé as early as November, 1842, that a party of Texans were upon the prairies, prepared to attack any Mexican traders who should cross the plains the succeeding spring; and as some Americans were accused of being spies, and in collusion with the Texans, many were ordered to Santa Fé for examination, occasioning a deal of trouble to several innocent persons. Than this, however, but little further attention was paid to the report, many believing it but another of those rumours of Texan invasion which had so often spread useless consternation through the country.

"So little apprehension appeared to exist, that in February, 1843, Don Antonio Jose Chavez, of New Mexico, left Santa Fé for Independence, with but five servants, two waggons, and fifty-five mules. He had with him some 10,000 or 12,000 dollars in specie and gold bullion, besides a small lot of furs. As the month of March was extremely inclement, the little party suffered inconceivably from cold and privations. Most of them were frost-bitten, and all their animals, except five, perished from the extreme severity of the season; on which account Chavez was compelled to leave one of his waggons upon the prairies. He had worried along, however, with his remaining waggon and valuables, till about the 10th of April, when he found himself near the Little Arkansas, at least 100 miles within the territory of the United States. He was there met by fifteen men from the border of Missouri, professing to be Texan troops, under the command of one John M'Daniel. This party had been collected, for the most part, on the frontier, by their leader, who was recently from Texas, from which government he professed to hold a captain's commission. They started, no doubt, with the intention of joining one Colonel Warfield (also said to hold a Texan commission), who had been upon the plains near the mountains, with a small party for several months, with the avowed intention of attacking the Mexican traders.

"Upon meeting Chavez, however, the party of M'Daniel at once determined to make sure of the prize he was possessed of, rather than take their chances of a similar booty beyond the United States boundary. The unfortunate Mexican was therefore taken a few miles south of the road, and his baggage rifled. Seven of the party then left for the settlements with their share of the booty, amounting to some 400 or 500 dollars a piece, making the journey on foot, as their horses had taken a *stampede* and escaped. The remaining eight, soon after the departure of their comrades, determined to put Chavez to death, for what cause it would seem difficult to conjecture, as he had been for two days their unresisting prisoner. Lots were accordingly cast to determine which four of the party should be the cruel executioners; and their wretched victim was taken off a few rods and shot down in cold blood. After his murder, a considerable amount of gold was found about his person, and in his trunk. The body of the unfortunate man, together with his waggon and baggage, was thrown into a neighbouring ravine; and a few of the lost animals of the marauders having been found, their booty was packed upon them and borne away to the frontier of Missouri.

"Great exertions had been made to intercept this lawless band at the outset; but they escaped the vigilance even of a detachment of dragoons that had followed them over 100 miles. Yet the honest citizens of the border were too much on the alert to permit them to return with impunity. However, five of the whole number (including three of the party that killed the man) effected their escape, but the other ten were arrested, committed, and sent to St. Louis for trial before the United States Court. It appears that those who were engaged in the killing of Chavez have since been convicted of murder, and the others, who were concerned in the robbery, were found guilty."

A Colonel Snively soon after organised a company of 175 men, who, about the same year falling in with others equipped for the like object, under a Colonel Warfield, commenced an attack on Mora, a village on the Mexican frontier. These men were soon worsted by the Mexicans and disbanded. They were soon followed by other expeditions, which derived no unimportant aid from some American citizens; and the result has lately caused much political discussion throughout the United States.

"But the most unfortunate circumstance," says Mr. Gregg, "attending this invasion of the prairies—unfortunate at least to the United States and to New Mexico—was the closing of the northern ports, to foreign commerce, which was doubtless, to a great degree, a consequence of the before-mentioned expedition, and which of course terminated the Santa Fé trade, at least for the present.*

"The inhabitants of New Mexico are indolent, intolerant, systematically cringing, have no stability except in artifice, no profundity except for intrigue. The maladministration of the laws seems to be another impediment to their harmonious commercial intercourse with the traders from the United States.

"The most glaring outrages upon American citizens were committed in 1841, upon the occasion of the capture of the Texan Santa Fé expedition. In Taos, a poor deaf and dumb United States creole Frenchman was beaten to death in open day. In San Miguel, the alcalde, at the head of a mob, entered the store of a Mr. Rowland, whom he robbed of a considerable amount of merchandise. At the same time, the greatest excitement raged in Santa Fé against Americans, whose lives appeared in imminent danger; and a most savage attack was made upon our excellent consul, Manuel Alvarez, Esq., who had always taken an active interest in the welfare of American citizens.

"A few minutes after the governor had departed for San Miguel, to encounter the Texans, a fellow named Martin, his nephew and confidential agent, aided by a band of ferocious *sans culottes*, and armed with a large knife, secretly entered the house of the consul, who perceived him in time, however, to avert the blow; yet he received a severe wound in the face during the scuffle that ensued: the rabble running in at the same time, and vociferating, '*Saqueño afuera! matenlo!*'—Drag him out! Kill him! Mr. Alvarez, doubtless, owed his preservation partially to the consternation with which the failure of their clandestine attempt at his life inspired the cowardly ruffians. Instead of being punished for this diabolical act, the principal assassin on the contrary, was soon after promoted in the army.

"The outrage did not end here, however; for, on the consul's demanding his passport for the United States, it was refused for nearly a month; thus detaining him until the cold

* The following is the substance of Santa Anna's decree, dated at his palace of Tacubaya, August 7, 1843:—

"Article 1st.—The frontier custom-houses of Taos, in the department of New Mexico, Paso del Norte and Presidio del Norte in that of Chihuahua, are entirely closed to all commerce.

"Article 2nd.—This decree shall take effect within forty-five days after its publication in the capital of the Republic."

It should be understood that the only port in Mexico for foreign goods was nominally Taos, though the custom-house was at Santa Fé, where all the entrances were made.

season had so far advanced, that, of his party (about fifteen in number), two perished from the cold; and not one arrived without being more or less frost-bitten—some very severely—besides suffering a loss of about fifty animals from the same cause.

“With a view of oppressing our merchants, Governor Armijo had, as early as 1839, issued a decree exempting all the natives from the tax imposed on store-houses, shops, &c., throwing the whole burden of impost upon foreigners and naturalised citizens; a measure clearly and unequivocally at variance with the treaties and stipulations entered into between the United States and Mexico. A protest was presented, without effect; when our consul, finding all remonstrances useless, forwarded a memorial to the American minister at Mexico; who, although the vital interests of American citizens were at stake, deemed the affair of too little importance, perhaps, and therefore appears to have paid no attention to it. But this system of levying excessive taxes upon foreigners, is by no means an original invention of Governor Armijo. In 1835, the government of Chihuahua having levied a *contribucion de guerra* for raising means to make war upon the savages, who were laying waste the surrounding country, foreign merchants, with an equal disregard for their rights and the obligations of treaties, were taxed twenty-five dollars each per month; while the native merchants, many of whom possessed large haciendas, with thousands of stock, for the especial protection of which these taxes were chiefly imposed, paid only from five to ten dollars each. Remonstrances were presented to the governor, but in vain.

“For a few years, Governor Armijo established a tariff of *his own*, entirely arbitrary, exacting 500 dollars for each waggon-load, whether large or small, of fine or coarse goods. Of course, this was very advantageous to such traders as had large waggons and costly assortments, while it was no less onerous to those with smaller vehicles, or coarse, heavy goods. As might have been anticipated, the traders soon took to conveying their merchandise only in the largest waggons, drawn by ten or twelve mules, and omitting the coarser and more weighty articles of trade. This caused the governor to return to an *ad valorem* system, though still without regard to the *Arancel general* of the nation. How much of these duties found their way into the public treasury, I will not venture to assert.

“The arrival of a caravan at Santa Fé changes the aspect of the place at once. Instead of the idleness and stagnation which its streets exhibited before, one now sees everywhere the bustle, noise, and activity of a lively market town. As the Mexicans very rarely speak English, the negotiations are mostly conducted in Spanish.

“Taking the circuit of the stores, I found they usually contained general assortments, much like those to be met with in the retail variety stores of the west. The stocks of the inexperienced merchants are apt to abound in unsaleable goods—*mulas*, as the Mexicans figuratively term them.

“Although a fair variety of dry goods, silks, hardware, &c., is to be found in this market, domestic cottons, both bleached and brown, constitute the great staple, of which nearly equal quantities ought to enter into a ‘Santa Fé assortment.’ The demand for these goods is such, that at least one-half of our stocks of merchandise is made up of them. However, although they afford a greater nominal per centum than many other articles, the profits are reduced by their freight and heavy duty. In all the southern markets, where they enter into competition, there is a decided preference given to the American manufactures over the British, as the former are more heavy and durable. The demand for calicoes is also considerable, but this kind of goods affords much less profit. The quantity in an assortment should be about equal to half that of domestics. Cotton velvets and drillings whether bleached, brown, or blue, and especially the latter, have also been in much request. But all the coarser cotton goods, whether shirtings, calicoes, or drillings, &c., were prohibited by the *Arancel*, or tariff, of 1837, and still continue to be, with some modifications.”

The valley of the Rio del Norte, extending about 100 miles north, and 150 miles south of Santa Fé, seems remarkable for its beauty, richness of produce, and diversity of soil.

"Whatever is thrown into its bosom," says Mr. Gregg, "if the early autumn frosts permit it to ripen, grows to a wonderful degree of perfection—crops have often yielded over a hundredfold. This exuberance of soil is not, however, common to New Mexico generally, but rather proper to its valleys. The temperature is uniformly genial and moderate—a sultry day at Santa Fé, is of rare occurrence. The atmosphere is of extraordinary dryness, owing most probably to the great elevation of the plains about the Rocky mountains.

"Cotton is but little cultivated here, although it has been considered indigenous to the country, the early manufactures of the aborigines proving the fact, especially in this province. Tobacco is also a native plant; but, owing to the monopolising influence of the government, its culture is not deemed worthy of much notice by the inhabitants. Flax is likewise entirely neglected, as also the potato, another indigenous plant.

"The New Mexicans are celebrated for the manufacture of coarse blankets, which is an article of considerable traffic between them and the southern provinces, as also with the neighbouring Indians; and, on some occasions, with the United States. The finer articles are curiously woven in handsome figures of various colours. These are of different qualities, the most ordinary being valued at about two dollars apiece, while those of the finest texture, especially their imitations of the *Sarape Navajo*, will sell for twenty dollars, or more. There have been also made in New Mexico a few imitations of the *Sarape Saltillo*, the blanket of Saltillo, a city of the south, celebrated for the manufacture of the most splendid fancy blankets, singularly figured with all the colours of the rainbow. These are often sold for more than fifty dollars each. What renders the weaving of the fancy blankets extremely tedious is, that the variegation of colours is all effected with the shuttle; the texture, in other respects, being perfectly plain, without even a twill. An additional value is set upon the fine *sarape*, on account of its being a fashionable substitute for a cloak. Indeed, the inferior *sarape* is the only over-dress used by the peasantry in the winter.

"Besides blankets, the New Mexicans manufacture a kind of coarse twilled woollen stuff, called *gerga*, which is checkered with black and white, and is used for carpets, and also by the peasantry for clothing; which, in fact, with some other similar domestic stuffs, together with buckskin, constituted almost the only article of wear they were possessed of, till the trade from Missouri furnished them with foreign fabrics at more reasonable prices than they had been in the habit of paying to the traders of the southern provinces. Their domestic textures are nearly all of wool, there being no flax or hemp, and but little cotton spun. The manufacture even of these articles is greatly embarrassed, for want of good spinning and weaving machinery. Much of the spinning is done with the *huso* or *malacate* (the whirlingig spindle), which is kept whirling in a bowl with the fingers, while the thread is drawn. The dexterity with which the females spin with this simple apparatus is truly astonishing.

"I have heard of some still more curious contracts in these measurement sales, particularly in Santa Fé, during the early periods of the American trade. Every thing was sometimes rated by the vara—not only all textures, but even hats, cutlery, trinkets, and so on! In such cases, very singular disputes would frequently arise as to the mode of measuring some particular articles; for instance, whether pieces of ribbon should be measured in bulk, or unrolled, and yard by yard; looking-glasses, cross or lengthwise; pocket-knives, shut or open; writing-paper, in the ream, in the quire, or by the single sheet; and then, whether the longer or shorter way of the paper; and many others."

The editor of the *Independence Journal*, who says he has been at some pains to collect information in regard to the Santa Fé trade,

"Estimates the exports at 400,000 dollars in specie, and buffalo robes, furs, &c., to the amount of 50,000 dollars more. Several of the companies, which came in last spring, have not returned, in consequence of the unfavourable state of the weather. For this reason the exports are much less this year than usual. Four companies went out this year, taking with them merchandise to the value, at eastern cost, of 200,000 dollars—the insurance, freight to that point, outfits, &c., cost another 100,000 dollars; making the whole sum invested in this trade 300,000 dollars, which would have been increased to 500,000,

but for the bad weather. In the four companies there were 160 men, and the outfit for them is stated as follows :—

	Dollars
780 mules, worth each 25 dollars	27,300
60 oxen, " 30 "	1800
5000 lbs. bacon, at 3½ cents	182
30 barrels flour, at 5 dollars	120
90 bushels meal, 30 cents	27
Merchandise, outfit for hands	3500
Harness for teams	2500
Blacksmiths' work	500

Making, altogether, the sum 35,959

exclusive of waggons, waggon sheets, and many other articles purchased at that place. The number of waggons was 92, each costing 180 dollars, many of which were made there; and the total number of waggon sheets was 1300, including blankets to put between them.

"The trade with Santa Fé is thus made to amount to 750,000 dollars; but even this sum is said to be considerably short of what it is in ordinary seasons. The *Independence* editor insists that the trade should no longer be neglected by the government. 'Give us a port of entry; give us the right of drawbacks, and our traders will supply the whole of the provinces of Santa Fé, Chihuahua, Sonora, California, and others, instead of being supplied with British goods through Metamoras, Vera Cruz, and other ports. Instead of the trade being worth half a million of dollars, it will reach to four or five millions.' The east is said to be deeply interested in this trade, as furnishing an outlet for their calicoes and domestics—Missouri is interested; and the editor hopes that Congress will act upon this matter next winter, and give to our traders all the benefits which those of other nations enjoy.

"The waggon-makers of Independence have orders to build seventy-five waggons for the Santa Fé trade, by next spring—only fifty were made the past spring. Several new mercantile establishments have just been located there, and all are doing well. A turnpike-road from Independence to Wayne city, on the river, will be completed as rapidly as possible. All that is wanted to make Independence one of the most important towns in Missouri, is to make it a port of entry, and for the legislature to establish a branch of the bank at that place, to accommodate the traders, and the commerce of the western part of the state."

Some of the gold mines of New Mexico are said to be very productive and valuable, although latterly, Mr. Gregg seems to think, they have been neglected.

CHAPTER XXI.

COASTING AND FOREIGN NAVIGATION AND TRADE OF THE UNITED STATES.

THE COASTING TRADE of the United States of America, includes not only the carrying trade of the products or manufactures of one state to another, as the cotton of the south to the north, and the manufactures of the north and the products of the fisheries to the south; but it comprises also the carrying of foreign produce and manufactures from the great depôts of New York, Boston Philadelphia, Charleston, and New Orleans (see trade of those ports), to minor ports of distribution. The whole coasting trade of the United States we know to

be of great value from the tonnage which it employs, but we are ignorant of its actual value, as there are no customs' accounts kept between one state and another. Of the value of the coasting trade of England we are in like manner ignorant, from the absence of official accounts being kept of it.

THE FOREIGN NAVIGATION AND TRADE of the United States extends to every maritime country in the world, and the trading enterprise of the citizens of the great republic may be said to exceed even that of the inhabitants of the British empire.—(See *Trade and Navigation between the United Kingdom and the United States.*)

NAVAL ARCHITECTURE.—The early English colonists found it necessary to begin, soon after their first settling in the New England States and in Virginia, the building of boats and coasting vessels; and the Dutch followed the example on the Hudson.

The construction of shipping, whether sailing ships; steam-vessels, or small craft and boats, constitutes one of the most important employments in the country. The vessels of the United States have long been remarkable for their beauty, and for their admirable sailing qualities, and the epithet of *fir built ships* with bits of *striped bunting*, used in a derisive sense, corresponds not with the character of those splendid ships built of the durable tough oak of Virginia and other states;* and which sail proudly over all the oceans of the world.

The details of the tonnage of the United States will be found hereafter in an account of the navigation and trade of the United States.

In 1772, the number of vessels built in the British colonies was 172, tonnage 26,546; viz. :—built in the New England colonies 149, tonnage 18,149. In New York, 15; New Jersey, 1; Pennsylvania, 8; Maryland, 8; Virginia, 7; North Carolina, 3; South Carolina, 2; Georgia, 5.

After the revolution, and when the constitutional government of the United States was established, the ships of the whole union were placed under one general flag.—(See *Commercial Legislation of the United States.*)

By the Colonial Custom House books, kept at Boston by the Inspector-general of the Imports and Exports of North America, and Register of Shipping, it appears, that the amount of tonnage which entered into the provinces, now the United States, from January 5, 1770, to January 5, 1771, was 331,644; and the amount cleared during the same period, was 351,686.—*Lord Sheffield on American Commerce.*

It is well known, that the tonnage at that time, given in to the register, was about one-third less than the actual tonnage, in order to evade the duties, light money, and expenses. But this was far more than counterbalanced, by the tonnage of the same vessel, being, in many instances, repeated, in consequence

* The red and brown cedar which abound in the United States are remarkably durable woods. The red pine is one of the most valuable woods for the decks and ceiling of ships.

of different voyages in the same year. The actual amount of tonnage, employed at that time in the colonial trade, may, therefore, be estimated at about 300,000

This tonnage was owned, first, by persons residing in the European British dominions; secondly, by British merchants, occasionally residing in the colonies; and, thirdly, by native colonial merchants; and, according to an estimate of British statesmen, in the following proportions, in the several colonies:—

COLONIES.	Proportion belonging to British Merchants.		Proportion belonging to Native Colonial Inhabitants.
	Resident in Europe.	Occasionally resident in the Colonies.	
New England.....	1-8th.	1-8th.	6-8ths.
New York	3-8ths.	3-8ths.	3-8ths.
Pennsylvania.....	2-8ths.	3-8ths.	3-8ths.
Maryland and Virginia.....	6-8ths.	1-8th.	1-8th.
North Carolina.....	5-8ths.	2-8ths.	1-8th.
South Carolina and Georgia	5-8ths.	2-8ths.	1-8th.

THE Amount Entered and Cleared in the several Colonies, during the Year above mentioned, was as follows:—

COLONIES.	Entered.	Cleared.	COLONIES.	Entered.	Cleared.
	tons.	tons.		tons.	tons.
New Hampshire.....	15,362	20,192	Virginia.....	44,803	45,179
Massachusetts.....	65,271	70,284	North Carolina.....	20,963	21,490
Rhode Island.....	18,667	20,661	South Carolina.....	29,504	32,031
Connecticut.....	19,223	20,263	Georgia.....	9,914	10,604
New York.....	25,539	26,653			
Pennsylvania.....	50,901	49,654	Total.....	330,624	350,485
Maryland.....	30,477	33,474			

Several of the the colonial ships cleared were sold in Great Britain.

The whole number of vessels belonging to the United States, on the 31st of December, 1830, was 12,256; and of this number, 943 were ships, 1371 brigs, the residue were sloops and schooners. Among this number, 343 were employed in steam navigation, and 1393 of those licensed were under twenty tons, leaving 10,863 over twenty tons' burden.

In 1831, the number of ships built were:—

1. *Registered vessels* employed in foreign trade, viz., sixty-six ships, seventy-two brigs, forty-five schooners, seven sloops, four steam-boats; 45,720 tons. There were sold to foreigners nine ships, twenty-one brigs, thirty-one schooners, and seven sloops; 9750 tons. Lost at sea, nine ships, fifty-three brigs, forty-eight schooners, and three sloops; 17,446 tons. Condemned as being unseaworthy, seven ships, twenty-three brigs, five schooners, and two sloops; 7288 tons; which leaves an increase to be added to the tonnage of 11,236 tons, out of 45,720 registered on foreign service tonnage.

NUMBER of Vessels, and the Seamen Employed in navigating the Same, which belonged to each State and Territory of the United States, on the 31st of December, 1830.

Ship-building in Maine.—"We understand that ship-building has never been carried on so extensively in Maine as during the present season. Many large and valuable ships have been recently launched, and many others are now on the stocks in most of the seaport towns. And these ships are generally built of the best seasoned white oak from the middle states, of fine models, thoroughly fastened, and finished in beautiful style.

"Among the ships now in the stocks, are two at Newcastle, one of 750 tons, and another of 800 tons ; these are both elegant specimens of merchant ships. At Bath, the ship *Hannibal*, of 650 tons, is almost ready for launching. The ship *South Carolina*, of 769 tons, was launched some days since, and the ship *Rapahannock* is almost ready for launching. This is the largest merchantman ever built in the United States. Her length on deck is 180 feet, her beam thirty-seven feet, and her depth twenty-three feet four inches, and she measures about 1140 tons! This ship is thoroughly built of Virginia white oak and Georgia pine."—*Boston Mercantile Journal*, 1841.

Ship-building.—"A correspondent of the *Evening Post* communicates the following facts, which he collected at the Novelty Works on Wednesday :—

"There are now building, and in progress of building, at the Ship Yards, on the East River, in this city, and the Navy Yard, Brooklyn, the following vessels :—

	Tons.
At William Brown's yard, Novelty Works yard, one steamer, from	1200 to 1300
At Jabez Williams's yard, one ship	740
" " one brig	350
At Webb and Allen's yard, one ship	525
At Ficket and Tomes's yard, one ship	500
At Smith, Demon, and Comstock's yard, one ship	950
At Brown and Bell's yard, two steamers, 600 tons each	1200
" " one schooner	100

Carried forward 5665

	Tons.
Brought forward	5665
At Westervelt's yard one ship (contracted for and in progress of building)	950
At " " one ship	800
At Lawrence and Sneed's yard, by "King and Denyke, one brig "	300
At Berg's yard, one ship	900
At the Railway, one steamer lengthening and rebuilding	300
<i>Navy Yard, Brooklyn.</i>	
One steamer for government, about	1,400
Three sloops of war repairing (average about 800 tons each)	2,400
Total	12,715
"There are also building in the city of Brooklyn over 200 dwelling houses, of wood and brick, and brick and stone.	
	Tons.
Ships and vessels building	8,615
Repairing	4,100
Total	12,715

Public Sale of Ships at Philadelphia.—"The three following Philadelphia built ships were sold at the Exchange, by Mr. C. J. Wolbert:—

"Ship *Lehigh*, built in 1833, coppered last fall, 585 10-95 tons, stows 7000 barrels of flour, 1100 tons of Canton goods, or 1685 bales of New Orleans cotton, sold for 24,500 dollars, on a credit of four months.

"Ship *Osage*, built in 1835, stows 5500 barrels of flour, 467 39-100 tons, sold for 14,500 dollars, on a credit of four months.

"Ship *Commerce*, built in 1832, measures 439 82-90 tons, stows 6000 barrels of flour, or 1500 bales of New Orleans cotton, was sold for a whaler, and brought 13,300 dollars, four months' credit."—*U. S. Gaz.*, July 15, 1841.

A large Ship.—"We notice in the *St. John New Brunswick Courier*, the launch of the splendid ship *Greenock*, and we believe the largest merchantman ever built in North America. Her dimensions are: length of keel 182 feet, breadth of beam thirty-six feet, depth of hold twenty-three feet and a half, and from figure head to taffrail 225 feet; her measurement will be nearly 1400 feet; and it is supposed she will carry 2400 tons, or 2500 tons of timber and broken storage. Her model and fastenings are on an improved principle, with a beautiful bow and a light stern."

An old Ship.—"The *St. John New Brunswick Herald*, of the 27th of May, 1841, says, 'the curious in naval architecture, may have an opportunity of gratifying their curiosity, by a sight of a vessel now in our harbour; the *Volunteer*, of Hull. This antique specimen of British oak, is 110 years old, and was employed as a transport prior to the taking of Quebec. She is the identical ship in which the immortal Wolfe came to this continent. Should she come in contact now with one of our province built vessels, she would be found a hard nut to crack.'

DUTIES on the following Materials used in Ship building, in the British and American Tariffs.

BRITISH TARIFF.	Duty.	AMERICAN TARIFF.
Iron	free.	25 dollars per ton, or about 33 per cent.
Copper	10s. per cwt.	25 to 30 per cent.
Cordage	6s. per cwt.	4½ cents per lb., about 40 per cent.
Timber, used in (except oak and fir)	free.	All sorts, hewn or sawn, 20 to 30 per cent.
Oak and fir, foreign	17. 5s. per ton.	
Ditto, from American colonies	1s. per ton.	
Chains and anchors	15 per cent.	About 33 per cent.
Sailcloth	do.	7 cents per square yard, or about 20 per cent.
Naval stores	free.	20 per cent ad valorem.

The increase of American tonnage and the decrease of foreign tonnage are more marked in the clearances than in the entries. The foreign tonnage has declined 50,000 tons since 1837, while the American has increased steadily nearly 400,000 tons, or 33½ per cent.

This exhibits a regular increase in the American tonnage, and a falling off in the foreign tonnage. The aggregate of tonnage entered in 1840 was much larger than in any former year.

AMOUNT of American and Foreign Tonnage cleared from the United States for Foreign Countries for five Years.

YEARS.	AMERICAN.		FOREIGN.		TOTAL.
	number of vessels.	tons.	number of vessels.	tons.	tons.
1840.....	7583	1,647,689	4083	706,186	2,353,875
1841.....	7790	1,634,156	4584	76,849	2,370,405

1844.....	8343	2,010,924	5500	906,814	2,917,738

About one half of the aggregate amount of tonnage engaged in the export trade is foreign, a large portion of which is British. The American tonnage cleared from the United States in 1835, was greater than in 1843, and the foreign tonnage cleared in 1837 was greater than any year before or since.

STATEMENT of the Tonnage of American Vessels employed in the Trade with Foreign Countries, which entered Inwards and Cleared Outwards, at the Ports of the United States, distinguishing the Trade with each Country in each Year, from 1821 to 1831, and from 1835 to 1841.

CHAPTER XXII.

FOREIGN TRADE OF THE UNITED STATES OF AMERICA.

DURING the colonial government of the English settlements in the countries now forming the United States, although the absurd and mischievous commercial policy of the rulers and legislators of the British empire limited the navigation, industry, and trading enterprise of the colonists, yet the persevering Anglo-Saxon spirit of the colonists urged them over the seas to every port in the world, except those to which the navigation laws prohibited them to trade.

The following brief chronological sketch will exhibit the progress of the navigation and trade of the old British colonies, and of the United States, until the year 1800.

1607. The first permanent settlement, after various disastrous attempts, established in Virginia.

1609. Henry Hudson, an Englishman in the service of the Dutch, sailed from the Texel in the beginning of this year, with the design of sailing to the East Indies by a north-west course. He entered into the river Manhattan, and departed in October for England. Dutch ships were sent the next year to open a trade with the natives.

1616. *Tobacco* about this time first cultivated by the English in Virginia.

Four ships sailed from London, and four from Plymouth to New England, from whence they carried cargoes of fish and oil, which were sold with profit in Spain and the Canary islands.

1618. The only commodities exported from Virginia, at this time, were tobacco and saffaras. The use of the plough introduced in Virginia.

1619. *Tobacco*.—King James prohibited the sale of tobacco, in gross or retail, either in England or Ireland, until the custom should be paid and the royal seal affixed. Twenty thousand pounds of tobacco exported this year from Virginia to England, nearly the whole crop of the preceding year.

1621. *Parliamentary Acts respecting Tobacco*.—The English parliament resolved, "that all foreign tobacco shall be *barred*, but that of Virginia, or any of the king's dominions, shall not be held foreign." A bill, for the restraint of the inordinate use of tobacco passed in May. *No tobacco was to be imported after the 1st of October, 1621, but from Virginia and the Somers isles, and, after that day, none was to be planted in England.* There was to be paid to the king, for custom, *sixpence a pound*, in consideration of the loss he might sustain in his revenue. None was to be sold by the merchant for more than *eight shillings* the pound, but they who should sell tobacco by the pipe, might make the most they could. *This is the first instance of the policy of promoting the importation of the produce of the colonies in preference to the produce of foreign States.*

1622. *Tobacco*.—The tobacco exported from Virginia to England, on an average, for seven years previous to 1622, amounted to 142,085 pounds a year.

Fishery.—Thirty-five ships which sailed this year from the west of England, and two from London, to fish on the New England coasts, made successful voyages.

Limit on the Trade to New England.—The Plymouth company complained to King James of the encroachments and injuries of interlopers on their American commerce and possessions, and applied to him for relief. The king issued a proclamation, commanding that none should frequent the coasts of New England but the adventurers and planters, or traffic with the Indians, otherwise than by the licence of the council of Plymouth. Chalmers says, "This remarkable edict, far from proving beneficial to the company, really brought on its dissolution."

1624. *Fishing*.—About fifty English ships sailed in the spring of this year, to fish on the coasts of New England.

1626. *Newfoundland Fishery*.—The coast of Newfoundland, for several years frequented by about 250 sail of English vessels, estimated at 15,000 tons, employing 5000 persons, and an annual profit of about 135,000*l.* sterling.

1627. *Trade of the Colony of Plymouth*.—The governor and others hired the trade of the colony for six years; and for this privilege, together with the *shallop* and the *pinnace* built at Monamet, undertook to pay 1800*l.* and all other debts of the planters; to bring over to them 50*l.* a year in hoes, shoes, and sell them for corn at 6*s.* a bushel; and, at the end of the term, to return the *monopoly* to the company.

1628. *Dutch Trade with Plymouth*.—A Dutch bark, from Manhattan, arrived at Plymouth, New England. After this commencement of trade, the Dutch often sent goods to the same place, and a traffic was continued for several years. The Plymouth colonists exchanged tobacco for linens, stuffs, and other articles.

1631. *Corn made a Legal Tender*.—In Massachusetts, the court of assistants ordered, that corn should pass for payment of all debts at the usual rate for which it was sold, unless money were expressly named.

1633. *Trade in Connecticut*.—Several trading-vessels sailed up the Connecticut river in the course of the year.

1639. *Act to Encourage the Fishery*.—The legislature of Massachusetts passed an act, to free from all duties and public taxes, all property employed in catching, *curing*, or transporting fish.

1641. *Trading Post at Narraganset*.—Richard Smith purchased of the *Sachems*, a tract of land in the Narraganset country, distant from the English settlements; erected a house of trade, and entertained all passing travellers.

1642. *Trading Post at the Delaware*.—The colonists of New Haven sent agents, who purchased of the natives several tracts of land on both sides of Delaware bay and river, and then erected a trading post. Kref, the Dutch governor of New Netherlands, without any previous notice, sent forth his soldiers, who burned the trading post, and seized the goods at the Delaware.

Iroquois Trade with the Dutch.—The Iroquois carried a considerable trade with the Dutch at Albany, who gave the Iroquois in return fire-arms, ammunition, &c.

1645. *Impost on Wines, &c.*—The general court of Massachusetts levied an impost on wines and strong liquors, for the pay of government, the maintenance of fortifications, and the protection of the harbours.

Iron Works at Lynn.—The general court of Massachusetts this year granted liberty to make iron. An iron work was begun in Lynn.

Virginia Currency.—The legislature of Virginia prohibited dealing by barter, and established the Spanish piece of eight, at six shillings, as the standard currency for that colony.

1646. *Impost on Exports from Connecticut.*—In a contract made in 1644, between George Fenwick and the agents of the colony of Connecticut, it was stipulated, that a certain duty on corn, biscuit, beaver, and cattle, exported from the river's mouth, should be paid to Fenwick for the space of ten years. This agreement was confirmed the succeeding year by the legislature, which, at the same time, passed an act, imposing a duty of twopence per bushel on all grain, sixpence on every hundred weight of biscuit, and a small duty on all beaver skins exported from the mouth of the river during the same period.

1646-7. *Origin of the Navigation Act.*—By an ordinance of the lords and commons of England, all merchandise, goods, and necessities, for the American plantations, were exempted from duty for three years, on condition that no ship or vessel, in any of the colonial ports, be suffered to land any goods of the growth of the plantations, and carry them to foreign ports, excepting in English bottoms.

1647. *Trade with the West Indies.*—A trade opened this year between New England and Barbadoes, and other islands in the West Indies, profitable to the colonists, and enabling them to make payments in England.

1651. *Navigation Act.*—The parliament of England passed the famous navigation act. It enacted, "That no merchandise, either of Asia, Africa, or America, including also the English plantations there, should be imported into England, in any but English built ships, and belonging either to England, or English plantation subjects, navigated also by an English commander, and three-fourths of the sailors to be Englishmen, excepting such merchandise as should be imported directly from the original place of their growth or manufacture, in Europe solely; and that no fish should, thenceforward, be imported into England or Ireland, nor exported thence to foreign ports, nor even from one of their own home ports, but what should be caught by their own fisheries only." This act was evaded at first by New England, which still traded in all ports, and enjoyed the peculiar privilege of importing their goods into England free of customs.

1652. *Mint in Massachusetts.*—A mint was erected this year in New England for coining money. The money coined was shillings, sixpences, and threepences. The law enacted, that 'Massachusetts' and a tree in the centre, be on one side, and 'New England' and the year of our Lord, and the figures XII., VI., III., according to the value of each piece, be on the other side. The several coins had N. E. on one side, and the number with the year 1652 on the other. This date was never altered, though more coin was stamped annually for thirty years.

1655. *Change in the Virginia Currency.*—The Virginia legislature changed the Spanish piece of eight from six shillings to five shillings sterling, as the standard of its currency.

1660. *Navigation Act altered and confirmed.*—The navigation act of 1651, continued, with additions. It enacted, that no sugar, tobacco, ginger, indigo, cotton, fustic, dying-woods, of the growth of the English territories in America, Asia, or Africa, shall be transported thence to any other country, than those belonging to the crown of England, under the penalty of forfeiture; and all vessels sailing to the plantations were to give bonds to bring said commodities to England. The most submissive colonists considered the act as grievous, and contrived various methods to evade it.

1662. *Mint in Maryland.*—The assembly of Maryland besought the proprietary to make order for setting up a mint, and a law was passed for that purpose. "The great hindrance to the colony in trade for the want of money," is assigned as the reason for the measure. It was enacted, that the money coined shall be of as good silver as English sterling; that every shilling, and so in proportion for other pieces, shall weigh above ninepence in such silver; and that the proprietary shall accept of it in payment of his rents and other debts. This coin being afterwards circulated, the present law

was confirmed among the perpetual laws of Maryland, in 1676. This law and that of Massachusetts are the only laws for coining money which occur in colonial history previous to the American revolution.

1663. *Monopoly of the Colonial Trade*.—An act of parliament was passed this year to monopolise the colonial trade for England. It prohibited the importation, into any of the English colonies, in Asia, Africa, or America, of any commodities of the growth, production, or manufacture of Europe, except they were laden or shipped in England, Wales, or the Town of Berwick-upon-Tweed, and in English built shipping, and to be carried directly to the said colonies, with an exception of salt for the fisheries, wines from Madeira and Azores, and all sorts of victuals from Scotland and Ireland. Under this act, the colonists could obtain no European goods, but through the ports of England. A draw-back of the duties, however, was generally allowed on the exportation of those goods to the colonies.

1665. *Massachusetts Shipping*.—The number of ships and vessels belonging to the colony was about eighty, from twenty to forty tons; about forty, from forty to 100 tons; and about twelve ships, above 100 tons.

1669. *Hudson's Bay Company*.—Charles II. gave to Prince Rupert, and several lords, knights, and merchants, associated with him, a charter, under the title of "The Governor and Company of Adventurers of England, trading into Hudson's Bay." The entire sum which constituted the original funds of the company, amounted only to 10,500*l*.

1671. *Board of Trade and Plantations*.—A board of commissioners of trade, &c., was established this year. The first act of this board was the drawing up of a circular letter to the governors of all his majesty's plantations and territories, in the West Indies and islands belonging to them. Evelyn, a member of the board, says, "What we most insisted on, was to know the condition of New England, which appearing to be very independent as to their regard to England or his majesty, rich and strong as they now were, there were great debates in what style to write them, for the condition of that colony was such, that they were able to contest with all other plantations about them, and there was a fear of their breaking from all dependence on this nation."

1672. *Duties laid by Parliament on the Colonies*.—The parliament, considering the colonies as proper objects of taxation, enacted, that if any vessel, which by law may trade in the plantations, shall take on board any commodities, and a bond with sufficient security shall not have been given to unlade them in England, there shall be rendered to his majesty, for sugars, tobacco, ginger, cocoa-nut, indigo, logwood, fustic, cotton, wool, the several duties mentioned in the act. The duties of tonnage and poundage had been imposed and extended to every dominion of the crown, at the restoration, but this was the first act which imposed customs on the colonies, to be regularly collected by colonial revenue officers.

1676. *Custom of Tobacco*.—The whole custom of tobacco from Virginia, collected in England this year, was 135,000*l*. Maryland tobacco was probably included.

1678. *New York Exports and Imports*.—The annual exports, besides peas, beef, pork, tobacco, and peltry, were about 60,000 bushels of wheat. The annual imports were to the value of about 50,000*l*.

1681. *Commerce and Customs of Portsmouth*.—During the year ending with April, 1681, there were entered as Portsmouth, New Hampshire, forty-nine vessels, from ten to 150 tons' burden. The amount of the provincial customs, levied at that port during the same year, on wines and liquors, and one penny a pound of the value on the first cost of goods imported, was 61*l*. 3*s*. 1*d*. This was money of the province, which was of less value than sterling, thirty-three and one-third per cent.

1682. *Trade of Pennsylvania*.—A publication appeared this year, entitled, "The Articles of the Free Society of Traders in Pennsylvania, agreed upon by divers Merchants for the better Improvement and Government of Trade in that Province."

1683. *Carolina*.—To remedy the distress felt, by want of a common measure of commerce, the parliament of Carolina 'raised the value of foreign coins,' and suspended all prosecutions for foreign debts. The currency of Carolina became, in consequence, much depreciated. The second measure, though at first confirmed by the proprietaries, was

afterwards dissented from, "because it was contrary to the king's honour, since it was in effect to stop the course of justice; because the parliament had no power to enact a law so contrary to those of England."

1686. *New York*.—The city incorporated by a charter. The shipping belonging to the city of New York had increased to nine or ten three-masted vessels, of about eighty or ninety tons; 200 ketches or barks of about forty tons; and about twenty sloops of twenty-five tons.

1690. *First Paper Money in the Colonies*.—The government of Massachusetts issued bills of credit as a substitute for money.

1694. *Annapolis made a Port Town*.—The town of Severn, Ann county, in Maryland, was made a port town, and the residence of a collector and naval officer, and received the name of Annapolis.

1695. *Rice in Carolina*.—The planting of rice was introduced about this time into Carolina.

1696. *Shipping of New York*.—The shipping of New York at this time, consisted of forty ships, sixty-two sloops, and sixty boats.

Board of Trade and Plantations.—King William erected a new and standing council for commerce and plantations, styled, the lords commissioners for trade and plantations. With this board, the governors of the American colonies were obliged to hold a constant correspondence; and to this board, they transmitted the journals of their councils and assemblies, the accounts of the collectors of customs, naval officers, &c.

1699. *Wool Manufactures of America*.—Complaints being made in England, that the wool and woollen manufactures of North American plantations began to be exported to foreign markets, formerly supplied by England, a law was passed, by which no person might export in ships, or carry by horses, into any other place or colony out of the king's dominions, any wool or woollen manufactures of the English plantations in America, under forfeiture of ships and cargoes, and also of 500*l.* penalty. This is the first notice in the English statute laws of woollen manufactures in the colonies.

1700. *Population of Boston*.—Boston, at this time, contained about 1000 houses and above 7000 souls.

1701. *Duty imposed by Carolina*.—The assembly of Carolina, imposed a duty of three-farthings a skin, exported by residents, but double if sent out in English vessels.

Newfoundland Fishery employed this year 121 vessels, collectively, amounting to nearly 8000 tons' burden.

1702. *First Paper Currency of Carolina*.—A bill was passed by the provincial assembly, for stamping bills of credit which were to be taken up in three years by a duty laid upon liquors, skins, and furs. This was the first paper currency issued in Carolina. For five or six years after its emission, it passed in the country at the same value and rate with the sterling money of England.

1703. *Culture of Silk in Carolina*.—Sir Nathaniel Johnson about this time introduced the culture of silk into Carolina, but the planters considered rice their staple commodity.

1704. *Rhode Island Tonnage Duty*.—The legislature of Rhode Island imposed a tonnage duty on all vessels not wholly owned by the inhabitants of that colony.

Regulation of Coins.—The colonies, experienced great inconveniences from the difference in the value of the same coin. Queen Anne published a proclamation "for settling and ascertaining the current rates of foreign coin, in her majesty's plantations in America."

1712. *Bank Bills issued*.—South Carolina established a public bank, and issued 48,000*l.* in bills of credit, called bank bills, to be lent out at interest on landed or personal security, and to be taken in gradually at the rate of 4000*l.* a year. Hewatt says, "Soon after the emission of these bills, the rate of exchange and the price of produce rose, and in the first year advanced 150, in the second 200 per cent."

1713. *Connecticut*.—This colony had scarcely any foreign commerce at this time. Its principal trade was with Boston, New York, and the West Indies.

1714. *The First Schooner* is said to have been built about this time, at Cape Ann, by Captain Andrew Robinson.

1715. *Boston Lighthouse*.—The legislature of Massachusetts passed an act for erecting a lighthouse on Beacon Island, at the entrance of Boston harbour.

Pig and Bar Iron began about this time to be made in Virginia.

1716. *Exports from the Mississippi*.—Two ships went to France, richly laden, from the river Mississippi; and these were the first which carried over any merchandise from the Louisiana colony since its settlement.

Fish from Newfoundland.—From the Newfoundland fishery, there were exported this year, to Spain, Portugal, and Italy, 106,952 quintals of fish.

1717. *New Orleans Founded*.—In expectation of great advantages from the trade and commerce of Louisiana, the French this year founded New Orleans.

The Trade of Massachusetts employed 3493 sailors and 492 ships, of 25,406 tons.

1718. *Import Bill of Massachusetts*.—An import bill was passed by the legislature of Massachusetts, which laid a duty, on West India goods and wines, and on English manufactures, and a duty of tonnage on English ships. The duty on English goods was one per cent. Before the session in May, next year, the governor received instructions from the king to give all encouragement to the manufactures of Great Britain, and afterward received a reprimand from the lords justices, the king being absent, for consenting to the duty on English goods, &c. The court, on receiving official notice of this reprimand, "readily acknowledged the exceptions taken to that clause in the bill, were just and reasonable."

1719. *Lotteries Suppressed*.—Massachusetts passed an act for suppressing lotteries.

1720. *Trade with the French Prohibited*.—An act was passed for prohibiting the sale of Indian goods to the French.

Tea began to be used in New England about this time.

North-west Passage Attempted.—The Hudson-Bay Company sent out Captains Dwight and Barlow, with a ship and a sloop, for the purpose of making discoveries and finding a passage to China, by the north-west parts of America; but they were never heard of afterwards.

1722. *Trading-House Erected at Oswego*.—Governor Burnett, of New York, in order to command Lake Ontario, for the benefit of the fur trade and the friendship of the Six Nations, and to frustrate the commerce of the French, erected a trading-house at Oswego, in the country of the Senecas.

1723. *Pennsylvania Paper Currency*.—This province issued in March 15,000*l*. It made no loans but on land security, or plate, deposited in the loan-office; obliged the borrower to pay five per cent; made its bills a tender in all payments, on pain of confiscating the debt, or forfeiting the commodity; imposed penalties on all persons who presumed to make any bargain or sale on cheaper terms, in case of being paid in gold or silver; and provided for the gradual reduction of the bills, by enacting that one-eighth of the principal, as well as the whole interest, should be annually paid. The advantage of this first issue, induced the government, in the latter end of the year, to issue a further sum of 30,000*l*. on the same terms.

1724. *Trade of Carolina*.—There were this year imported into South Carolina, 493 slaves; also British goods and manufactures, to the value of between 50,000*l*. and 60,000*l*. sterling.

From the different harbours of Newfoundland there were exported this year, in fifty-nine vessels, 111,000 quintals of fish.

1727. *Act Respecting Salt*.—The parliament of England passed an act for the importing of salt into Pennsylvania, by British ships, regulated by the acts of navigation, for curing fish, in like manner as was allowed to New England and Newfoundland.

1728. *Exports from Carolina*.—The province was divided this year into two distinct governments, North and South Carolina. The exports of rice from South Carolina, during ten years, were 26,488 barrels, about 44,081 tons.

All the acts of Governor Burnett, for the prohibition of the trade between Albany and Montreal, repealed by the king.

1730. *Whale Fishery, &c.*—The whale fishery on the North American shores must, about this time, have been very important; for there arrived in England, from these coasts, in the month of July, 9200 tuns of train and whale oil, and 154 tons of whalebone. During

the first fifteen days of July, there arrived at London, from the American sugar colonies, upwards of 10,000 hogsheads of sugar, and 15,000 gallons of rum, and half as much more was computed to have been carried to Bristol, Liverpool, and Glasgow.

Exports from the Colonies.—Iron and copper ore, bees'-wax, hemp, and raw silk, the products of Virginia, were first exported from that colony to Great Britain; 50,000 weight of hemp, raised in New England and Carolina, were exported to England; seventy-two bags of wool, the product of Jamaica, St. Christopher's, and other West India islands, were exported thither, and great quantities of peltry, by the Hudson's Bay Company "All these articles," says Anderson, in his Annals, "excepting the last, were entirely new, and mostly unexpected productions, in those colonies."

1731. *Commercial State of Massachusetts.*—The colony of Massachusetts contained, this year, 120,000 English inhabitants. Its trade employed about 600 sail of ships and sloops, of at least 38,000 tons, one-half of which traded to Europe. Its fisheries employed from 5000 to 6000 men. There were, at the same time, in New England, eight furnaces for hollow-ware, and nineteen forges.

1732. *Corn and Tobacco a Legal Tender.*—The legislature of Maryland, this year, made tobacco a legal tender, at one penny per pound, and Indian corn at twenty-pence per bushel.

1733. *Exports from Carolina.*—There were exported this year from South Carolina, 36,584 barrels of rice, 2802 barrels of pitch, 848 barrels of turpentine, sixty tons of lignum vitæ, twenty tons of braziletto wood, twenty-seven tons of sassafras, and eight chests of skins.

1735. *The Population of Massachusetts was,* 138,427.

1736. *Trade of the Colonies.*—Maryland employed 130 sail of ships in its trade. The net product of tobacco, exported from that colony and Virginia, amounted, in value, to 210,000*l.*, and the annual profit to the mother country, from that trade, was estimated at 500,000*l.* The arrivals at the port of Philadelphia, this year, were 211, and the clearances 215. The arrivals at the port of New York were 211, and the clearances 222.

1739. *Scheme for Taxing the Colonies.*—During the British war with Spain, a scheme for taxing the British colonies was submitted to Sir Robert Walpole. "I will leave that," said the minister, "for some of my successors, who may have more courage than I have, and be less a friend of commerce than I am. It has been a maxim with me, during my administration, to encourage the trade of the American colonies in the utmost latitude. Nay, it has been necessary to pass over some irregularities in their trade with Europe; for, by encouraging them to an extensive growing commerce, if they gain 500,000*l.* I am convinced that, in two years afterwards, full 250,000*l.* of their gains will be in his majesty's exchequer, by the labour and product of this kingdom. As immense quantities of every kind go thither, and as they increase in their foreign American trade, more of our produce will be wanted. This is taxing them more agreeably to their own constitution and ours." The British parliament, however, passed an act, this year, for more effectually securing the trade of the British to America.

1741. *Massachusetts.*—There were now on the stocks in this state about forty top-sail vessels, of about 7000 tons. In Marblehead there were about 160 fishing schooners, of about fifty tons each.

1742. *The Entries at Philadelphia,* this year, were 230, and the clearances 281.

1743. *The Shipping of New England,* about this time, is said to have consisted of at least 1000 sail, exclusive of fishing barks. Ship-building, one of the principal branches of the trade of Boston, declined about this period.

Indigo.—The culture of indigo was introduced into South Carolina, by Miss Lucas. The cultivation of this valuable plant, being considered of importance, some indigo-seed was soon after imported from the West Indies, where it had been already cultivated with success and profit. At first the seed was planted as an experiment; and it was so successful, that several planters turned their immediate attention to the culture of indigo.

1744. *Trade of New Orleans.*—At the port of New Orleans, in Louisiana, several vessels came from Florida, and Havanna, and the Bay of Campeachy, to trade for boards, lumber, pitch, drygoods, and live-stock, to the value of 150,000 dollars.

Trade of South Carolina.—At the port of Charleston, 230 vessels were loaded, this year, and 1500 seamen were employed in the trade of the province.

1745. *Benjamin Franklin* published an account of his new invented fireplaces.

1747. *Tobacco.* On a medium of three years, there were exported to England, from the American colonies, 40,000,000 of pounds' weight of tobacco.

1748. *Bounty on Indigo.*—The parliament passed an act, for allowing a bounty of sixpence per pound on all indigo raised in the American plantations, and imported directly into Great Britain from the place of its growth.

Trade of Boston, Portsmouth, and Newport.—This year, 500 vessels cleared out from the port of Boston, for the foreign trade; and 430 entered inwards, exclusive of coasting and fishing vessels. The clearances from Portsmouth, New Hampshire, were 121, and the entries seventy-three, besides about 200 coasting sloops and schooners. The clearances from Newport, Rhode Island, were 118, and the entries fifty-six.

1749. *Entries and Clearances* at Boston, Philadelphia, and New London, this year, were as follows :—Boston, 489 entries, and 504 clearances; Newport, thirty-seven entries, and sixty-two clearances; Philadelphia, 303 entrances, and 291 clearances.

1750. *The Entries at New York,* were 232, and the clearances 286. Eight vessels cleared from Georgia, and the exports with which they were freighted, were valued at 2004*l.* sterling.

1751. *Commerce of Perth Amboy.*—The entries at this port, the capital of New Jersey, at that time, were forty-one, and the clearances thirty-eight. There were exported 6424 barrels of flour, 168,000 pounds of bread, and 17,941 bushels of grain, besides other commodities.

Flax-seed.—Six waggons, loaded with this article, came from the upland parts of Maryland into Baltimore.

Ginseng was found at Stockbridge, Massachusetts. It grew in abundance in that township, and in the adjacent wilderness.

1753. *Exports from North Carolina,* this year, amounted to 60,000 barrels of tar, twelve barrels of pitch, 10,000 barrels of turpentine, and about 30,000 deerskins, besides lumber and other articles.

1754. *Exports from South Carolina,* were, this year, 104,682 barrels of rice, and 215 pounds of indigo, which, together with naval stores, provisions, skins, lumber, and other products, amounted to the value of 240,000*l.* sterling. Cotton is also mentioned as an article of export.

The Massachusetts Marine Society was incorporated by an act of the legislature.

1755. *Population of the Colonies.*—Maryland contained 180,000 inhabitants, Rhode Island, 35,939, and New England, 436,936.

1764. *Parliament* passed an act for granting certain duties in the British colonies and plantations in America. This was the first act of the British parliament that ever was passed, in which the object of raising a revenue was directly expressed. It was intitled the sugar and molasses act.

1765. *Sugar Act.*—The sugar act, passed in 1764, restricted the intercourse which the American colonies had enjoyed with the West Indies, and caused general discontent.

The Stamp Act.—Parliament this year passed an act for raising revenue by a general stamp duty in all the American colonies. About 250 members in the house of commons voted for it, and fifty only against it. In the house of lords it passed unanimously, without debate, and obtained the royal assent. It caused the greatest discontent in the colonies. The stamp officers resigned; vessels sailed from ports as before; and the courts of justice, though suspended a while, in most of the colonies, at length proceeded to business without stamps.

1766. *The Stamp Act* repealed, by a majority of 275 to 167.

Salem Marine Society instituted for the assistance of distressed mariners and their families, promoting navigation, preserving and communicating all discoveries and occurrences in the voyages of its members, and receiving plans to facilitate the navigation of the port of Salem.

1767. *Duties.*—Parliament passed an act, imposing a duty to be paid by the colonists,

on paper, glass, painters' colours, and teas, imported into the colonies. Also an act, establishing a custom-house and a board of commissioners in America.

1768. *Non-Importation Agreement of Merchants.*—In August, the merchants and traders of Boston, generally, subscribed a paper, in which they engaged not to import, nor purchase any kind of goods or merchandise, imported from Great Britain, from January, 1769, to January, 1770, excepting a few enumerated articles; nor to import, nor purchase of any, who shall import from any other colony in America, within that time, any tea, paper, glass, or other goods, commonly imported from Great Britain. The Connecticut, Salem, and New York merchants, entered into similar agreements.

1769. *The Legislature of Virginia*, after being dissolved by the governor, met and adopted resolutions against importing British goods. This example was followed in other colonies, and the non-importation agreement became general.

Colonial Trade.—The trade of Great Britain with her colonies, on the continent of America, on an average of three years ending 1769, employed 1078 ships and 28,910 seamen. The value of goods exported from Great Britain during the average of the same years, was 3,370,000*l.*; and of goods exported from the colonies to Great Britain and elsewhere, 3,924,606*l.*

Grape Cultivated—The vine successfully cultivated at this time in Virginia.

1770. *Act to Repeal Duties, except on Tea, &c.*—The British merchants who traded to America sustained immense losses by the non-importation of their goods; and presented petitions to parliament, stating their losses, and praying for its intervention. On the 5th of March, Lord North proposed a bill for the repeal of part of the act of 1767, which laid a duty on glass, paper, and painters' colours, but continuing that part of the law which exacted a duty from tea. He said he brought forward that bill to prevent the continuance of the dangerous combinations which the imposts had produced in America, and the losses and dissatisfactions which they had caused among the merchants at home. He contended that the act was just as a claim, but unproductive of revenue. "The articles taxed," he said, "being chiefly British manufactures, ought to have been encouraged, instead of being burdened with assessments. The duty on tea was continued, for maintaining the parliamentary right of taxation. An impost of threepence in the pound could never be opposed by the colonists, unless they were determined to rebel against Great Britain. Besides, a duty on that article, payable in England, and amounting to nearly one shilling in the pound, was taken off on its exportation to America, so that the inhabitants of the colonies saved ninepence in the pound." He understood not the principles and feelings of the American colonists. They opposed the right of parliament to tax them far more than the tax itself. The members in opposition urged the injustice and inexpediency of taxing America, and the evils which had arisen from the attempt; but Lord North carried his bill by a large majority.

1772. *The Exports from Georgia*, in 217 vessels, amounted to 121,677*l.* sterling.

1773. *Duty on Tea resisted.*—The British government, determined to carry into execution the duty on tea. The warehouses of the East India Company contained about 17,000,000 lbs. of tea, for which there was no market. The East India Company were authorised by law to export their tea, free of duties, to all places whatever; by which regulation, tea would sell cheaper in America than before it had been made a subject of revenue. The new ministerial plan was considered as a direct attack on the liberties of the colonists, which it was the duty of all to oppose; and it was very generally declared that, whoever should, directly or indirectly, countenance this dangerous invasion of their rights, would be considered an enemy to his country. The East India Company freighted several ships to the colonies with tea, and appointed agents for its sale. Some cargoes were sent to New York; some to Philadelphia; some to Charleston, South Carolina; and three to Boston. The citizens of New York and Philadelphia sent the ships back to London. The inhabitants of Charleston unloaded the tea and placed it in cellars, prohibited its use, and left it to be thoroughly damaged. None of it was ever used.

Tea destroyed at Boston.—The citizens of Boston resolved to send back the tea ships. The captains of the ships had consented, if permitted, to return with their cargoes to England; but the consignees would not discharge them from their charter parties; the custom-house refused to give them a clearance; and the governor would not grant them a

passport for clearing the fort. It was known that the tea would be gradually landed from the ships lying so near the town; and that, if landed, it would be disposed of. To prevent this, a number of armed men, disguised like Indians, boarded the ships and threw their whole cargoes of tea into the dock.

The entries at the port of Boston, this year, were 587; the clearances, 411.

1774. *Boston Port Bill*.—Intelligence of the destruction of the tea at Boston was communicated on the 7th of March, in a message from the throne to both houses of parliament. The conduct of the colonists was represented, as not merely obstructing the commerce of Great Britain, but as subversive of the British constitution. Without a hearing on the part of the colonists, a bill was passed, by which the port of Boston was legally precluded from the privilege of landing and discharging, or of lading and shipping goods, wares, and merchandise; and every vessel within the points of Alderton and Nahant, was required to depart within six hours, unless laden with food or fuel. This act, which shut up the harbour of Boston, was speedily followed by another, entitled "An Act for the better regulating the government of Massachusetts." The object of this act was to alter the charter of the province, so as essentially to abridge the liberties of the people. In the apprehension that, in the execution of these acts, riots would take place, and that trials for murders, committed in suppressing them, would be partially decided by the colonists, it was provided by law, that if any person were indicted for murder, or for any capital offence committed in aiding magistracy, the governor might send the person, so indicted, to another colony or to Great Britain, to be tried. These three acts were passed in immediate succession. "By the first," said the colonists, "the property of unoffending thousands is arbitrarily taken away; for the act of a few individuals; by the second, our chartered liberties are annihilated; and by the third, our lives may be destroyed with impunity."

On arriving, copies of the port bill were quickly multiplied and circulated over every colony, and excited simultaneous indignation. At Philadelphia, a subscription was set on foot for such poor inhabitants of Boston as should be deprived of the means of subsistence by the operation of the act. The Virginia House of Burgesses resolved, "that the 1st day of June, the day on which the operation of the port bill was to commence, should be set apart by the members as a day of fasting, humiliation, and prayer, devoutly to implore the Divine interposition, for averting the heavy calamity which threatened destruction to their civil rights and the evils of a civil war; to give them one heart and one mind, firmly to oppose, by all just and proper means, every injury to the American rights." On the publication of this resolution, the royal governor, the Earl of Dunmore, dissolved them; but, previously to their separation, eighty-nine of the members signed an agreement in which they declared, "that an attack, made on one of our sister colonies, to compel submission to arbitrary taxes, is an attack made on all British America, and threatens ruin to the rights of all, unless the united wisdom of the whole be applied." They also recommended to the committee of correspondence to communicate with the several committees of the other colonies, on the expediency of appointing deputies to meet annually in general congress, to deliberate on those measures which the united interest of America might from time to time require.

On the day designated by the port act business was finished at Boston at twelve o'clock at noon, and the harbour shut up against all vessels. The day was devoutly kept at Williamsburg, in Virginia, as a day of fasting and humiliation. In Philadelphia, it was solemnised with every manifestation of public grief; the inhabitants shut up their houses, and, after divine service, "a stillness reigned over the city, which exhibited the appearance of a general mourning, or of the most solemn Sabath." In most other places it was observed as a day of mourning.

1775. *Bill for restraining the Commerce of New England*.—Lord North moved for leave to bring in a bill to restrain the trade and commerce of the provinces of New Hampshire, Massachusetts, Rhode Island, and Connecticut, to Great Britain, Ireland, and the British islands in the West Indies; and to prohibit those provinces from carrying on any fishery on the banks of Newfoundland, and other places to be mentioned in the bill, under certain conditions, and for a limited time. After much opposition in both houses, the bill was carried by a large majority.

Bill for restraining the Trade of the Middle and Southern Colonies.—Soon after

parliament had passed the bill for restraining the trade of New England, intelligence was received, that the inhabitants of the middle and southern colonies were supporting their northern brethren in every measure of opposition, a bill was in consequence brought in and passed for imposing similar restrictions on the colonies of East and West Jersey, Pennsylvania, Maryland, Virginia, South Carolina, and the counties on the Delaware. The omission of New York, Delaware, and North Carolina, in this bill, was considered in America as calculated to promote disunion; but the three exempted colonies scorned to accept the favour, and voluntarily subjected themselves to the same restraints as were imposed on the other colonies.

1777. *Bibles to be imported.*—It having been found, upon inquiry, that the proper types for printing the Bible were not to be had in America, and that the paper could not be procured but with great difficulties and risk, Congress directed the committee of commerce to import 20,000 copies of the Bible.

1781. *Bank of North America established.*—A national bank was instituted this year, projected by Robert Morris, one of the delegates of Pennsylvania, whom Congress had appointed treasurer. The capital of 400,000 dollars, he divided in shares of 400 dollars each, in money of gold or silver, to be procured by subscriptions. Twelve directors were to manage the bank, which was denominated by Congress, “The President, Directors, and Company of the Bank of North America.” To the financial skill of Mr. Morris the country was greatly indebted. Under his able management public credit revived; the army was paid; and public operations maintained in the field and the cabinet.

1784. *Trade of New Haven.*—The foreign trade of New Haven, which had been destroyed by the late war, revived. The number of vessels belonging to the port, engaged in the West India and foreign trade, amounted to thirty-three; of which number one was a ship of 300 tons, four were square rigged vessels, or brigs; the others, sloops of sixty to 110 tons.

First United States Voyage to China.—The *Empress of China*, a ship of 360 tons, commanded by John Green of Boston, sailed from New York in February for Canton, and returned the following year. This was the first voyage from the United States to China.

1785. *Treaty with Prussia.*—A treaty of amity and commerce was concluded between the King of Prussia and the United States.

1786. *Act for a Mint.*—An act was passed by the legislature of Massachusetts, for establishing a mint for the coinage of gold, silver, and copper.

1788. *Card Manufactory.*—A card manufactory was set up in Boston, with a newly invented machine, essentially lessening the necessity of manual labour.

Cotton planted in Georgia and Carolina.—Richard Leake, Esq., made an extensive and very successful experiment for the planting of cotton in Georgia. Several planters in Georgia and Carolina followed the example with success. The black cotton seed was brought about this time into Georgia from the Bahamas.

1789. *Barrell's Sound.*—Barrell's Sound, on the north-west coast of America, visited by Captain Gray in the *Washington*.

1791. *Bank of the United States.*—The United States Bank, with a capital of 10,000,000 dollars, was established at Philadelphia, by the style of “The President, Directors, and Company of the Bank of the United States.” The revenue of the United States was 4,771,200 dollars; and the expenditure, 3,798,436 dollars.

Exports from New York.—The exports from New York to foreign parts amounted 2,505,465 dollars.

Commerce of Providence.—The number of sail of vessels belonging to the county of Providence, in Rhode Island, was 129; the tonnage was 11,942.*

First Export of Cotton from the United States.—The first bale of cotton, of American growth, was exported this year from the United States to England.

Cotton Spinning.—A factory for spinning cotton by water power was put in operation by Samuel Slater, at Pawtucket, in Rhode Island.

1792. *United States Mint.*—Congress passed an act for establishing a mint, and regulating the coins of the United States.

* In 1764, there belonged to the same county fifty-four sail of vessels, of 4320 tons.

Banks.—The South Carolina Bank, the Bank of Pennsylvania, and the Bank of New Hampshire established. The Union Bank in Boston incorporated.

Exports of Charleston.—The exports from Charleston, South Carolina, this year, were estimated at 2,917,979 dollars.

Culture of Silk.—The rearing of mulberry-trees and silk-worms, and the culture of silk, so far succeeded in Connecticut, that a minister in Branford had a silk gown made for him this year at his own house. This was the first clergyman's gown made in America.*

Revenues of the United States.—The revenues of the United States estimated at 3,700,000 dollars. The tonnage of vessels which paid duty in the ports of the United States, between the 1st of October, 1791, and the 30th of September, 1792, including the coasting and fishing vessels, was upwards of 800,000 tons.

1793. *Navigation of New York.*—There entered the port of New York 683 vessels from foreign ports, and 1381 coasting vessels.

Exports of the United States.—The exports of the United States were estimated at upwards of 26,000,000 dollars.

1795. *Exports.*—The value of exports of the United States amounted to upwards of 47,000,000 dollars. The net value of imports and tonnage was nearly 8,000,000 dollars.

Charleston and Baltimore.—The first vessel from Carolina for the East Indies, sailed this year from Charleston. The value of imports to Baltimore was upwards of 5,000,800 dollars. There arrived at Baltimore, this year, 109 ships, 162 brigs and snows, and 5464 bay craft.

1797. *Exports and Post office.*—The value of exports from the United States amounted to 57,000,000 dollars. The mails of the United States were carried over 14,385 miles of territory; in which space there were upwards of 480 post-offices. The revenue of the post-office, this year, was 46,000 dollars.

1798. *Protection of Commerce.*—An act was passed more effectually to protect the commerce and coasts of the United States. This act was passed in May. In June, Congress passed an act to authorise the defence of the merchant vessels of the United States against French depredations.

1800. *Bankruptcy.*—Congress enacted a law for establishing a uniform system of bankruptcy.

Census, Shipping, and Post-office.—By the second census, the number of inhabitants was 5,305,482. The shipping of the United States amounted to 939,000 tons. The revenue of the post-office was 80,000 dollars.

Canal.—Santee canal, extending twenty-two miles between Santee and Cooper rivers, began to be passed through by boats. It cost the proprietors above 600,000 dollars; a sum exceeding seven times the amount of what the province sold for seventy-two years before."

1800 to 1845. Since the commencement of the present century, the progress of American navigation and trade will be found illustrated in the preceding and following tables. (*See also Commercial and Financial Legislation of England and America.*) The United States, for the first fifteen years, experienced some of the evils of European warfare, and, in common with England and the British possessions, the calamity attendant upon a war, which with more wisdom on the part of the respective governments, never would have occurred.

In advocating commercial freedom between nations, we have always done so, believing that the greater the international trade and consequent interests, the stronger were the bonds for a lasting peace. During the last thirty years, peace has happily subsisted between the mother land and America.

* Stiles, Lit. Diary. The Rev. Jason Atwater, minister of Branford, showed the gown to Dr. Stiles, who writes: "He raised and manufactured the silk from his own trees and worms." On the 20th of January, 1791, Dr. Stiles "saw a pair of silk stockings, woven at Norwich, in a loom made there—weighed four ounces—white. Also, a handkerchief made at Northford, two ounces and a half; both made of silk raised in New Haven and Northford."

IMPORTS and Exports of the United States for Fifty-five Years, Payments into the Treasury, and Cost of collecting Revenue.—For Details of the several States, see each State.

* From March 4. The net amount of duties on imports, from the 1st of October, 1789, to the 30th of September, 1790, according to the official report of the secretary, was 1,903,709 dollars 48¢ cents.

† To December 31, the following years end the 30th of September until 1842, inclusive.

‡ For nine months ending the 30th of June.

§ For the year ending the 30th of June.

We have already given detached tables of the principal articles exported.—
See PRODUCE OF MINES, of THE FOREST, of THE SEA, of AGRICULTURE, and
of MANUFACTURES.

IMPORTS into the United States from the 1st of October, 1795, to the 30th of September, 1844.

NOTE.—This table exhibits a very remarkable increase of the ratio of Foreign tonnage to the value of the cargo; showing how much the carriage of the bulky commodities of export has increased in Foreign vessels. In 1821, the Foreign tonnage carried 90,000,000 dollars' worth of cargo in 1,000,000 of tons; in 1840, it carried 29,000,000 dollars' worth of cargo in 1,000,000 tons—showing that the Foreign tonnage is rapidly getting possession of that branch of our carrying trade which requires the greatest amount of shipping, and which is, therefore, the most valuable to navigation.

STATEMENT of the Commerce of each State and Territory, commencing on the 1st day of October, 1820, and ending on the 30th day of September, 1821.

SUMMARY Value of Imports.

I M P O R T S.	1841	1842	1843*	1844
	dollars.	dollars.	dollars.	dollars.
Value of imports	127,946,177	100,162,087	64,753,799	108,435,035
Deduct specie	4,988,633	4,087,916	22,319,335	5,830,429
Value of merchandise imported.	122,957,544	96,075,071	42,434,464	102,604,606

* Nine months.

There has been a great decrease in the importation of certain manufactures, the demand for which has been chiefly supplied by home manufactures.

IMPORTATION of Manufactured Goods into the United States during the Years 1840, 1841, 1842, and 1844, leaving out 1843, as the returns were for only nine months, and cannot be correctly compared with the other years :—

				Total	92,560,996	77,793,783	99,715,179

* Nine months only, which excludes comparison for 1843.

Of the aggregate value of the exports, 69,706,375 dollars were shipped in American vessels, and 30,008,804 dollars in foreign vessels. More than one-half the value of exports from the United States in 1844, consisted of the single article of cotton. Tobacco comes next, and then flour.

TABLE exhibiting the Value of Imports from, and Exports to, each foreign Country, during the Year ending September 30, 1842, and nine Months ending June 30, 1843.

* This column is erroneously footed 8,397,255 dollars in the printed document, being 27 dollars too little.

† This column correctly foots 5,060,827 dollars—the difference of 27 dollars arises from the discrepancy in the tobacco column.

"The above table embraces a period of the complete operation of four general tariffs, viz.: the tariff of 1824, the high protective tariff of 1828, that of 1832, and the compromise act of 1833. From 1821 to 1830 the banking movement in the United States was remarkably steady. The loans of the United States Bank, which was the governing power, varied in all that time scarcely 3,000,000 dollars. The consequence was that every increase of the duties checked imports in a marked degree. In 1828 the imports were large previous to the operation of the tariff. In the two succeeding years they fell off immensely. In 1831, they began to feel the impulse of the bank movement. From 1830 to 1833, the national bank extended its loans from 40,000,000 dollars to 66,000,000 dollars, or sixty-five per cent in two years. This movement of the 'regulator' was followed by that of all the banks in the union, and by a combination of circumstances the inflation, with some drawbacks, continued to the great explosion of 1836-7; from which time the general movement of banks has been that of curtailment. From 1821 to 1825, the whole imports into New York rose 34,000,000 dollars, of which 26,000,000 dollars was in the port of New York. Under the tariff which came into operation in that year, the imports fell off 17,000,000 dollars in 1827; of which 9,000,000 dollars was in the port of New York. Under the tariff of 1828, a further fall of 9,000,000 dollars in 1830 took place; of which 6,000,000 dollars was in the port of New York. From that year up to 1836, under the bank expansion, a total increase in imports of 119,000,000 dollars took place; 83,000,000 dollars, or nearly eighty per cent of the amount, was in New York. Down to 1841, under decreasing duties, but a contracting currency, a decrease of 82,000,000 dollars took place; 68,000,000 dollars, or eighty-three per cent of this was in New York—an immense falling off in business. These facts show, concisely, that the two causes operate powerfully upon the welfare of New York, more than upon the rest of the union, viz.: a high tariff and a dear currency. Under the contracting currency with decreasing duties, the trade of New York fell off from 1839 to 1840, seventy-seven per cent. She has now to encounter a still further reduction of the currency, added to duties meant to be protective. Under such circumstances it is fair to conclude that the imports will be carried back to the grade, at least, of 1830, viz.: 70,000,000 dollars, or about 36,000,000 dollars in New York; and this at a time when the connexion of Boston with the western country, by railroad, has revolutionised the trade in domestic goods, and has withdrawn from New York a large commission business."—*Hunt's Magazine*.

CHAPTER XXIII.

NAVIGATION AND TRADE BETWEEN THE UNITED STATES AND THE UNITED KINGDOM.

THE commercial intercourse between the United Kingdom and the United States of America, is confined to the vessels of the respective countries, including the colonial possessions. This is much upon the same principle as before the independence of the Anglo-American colonies: excepting that the British crown subjected the colonial carrying trade with foreign countries to restrictions that were palpably unwise and unjust, though strictly in the narrow spirit of the Navigation act. Since the revolution, the ships of the United States trade to all the countries in the world.—(See *Commercial Legislation of England and the United States hereafter*.)

The early details of the trade between Great Britain and her colonial possessions were by no means attended to. Some accounts of entrances and clearances, and notices of the imports, were kept by the customs department, and from these the following tables have been compiled.

The accounts of the tonnage employed are mixed up with that engaged in the North American fisheries, and in the circuitous trade with the West Indies. It comprised a great share of the whole British navigation beyond the seas.

From the date of first passing the navigation law in 1660, in which act the exclusive restrictions to be observed in the trade and navigation of the plantations in America is declared, we have but scanty information respecting the commerce of the North American colonies until 1670, when we find they supplied the sugar plantations with cattle, hogs, flour, timber, slaves, and other lumber; and that "in time of dearth," the plantations of New York, New Jersey, and Pennsylvania, supplied even Britain and Ireland with corn.

In 1703, a law was passed to encourage the growth and importation of naval stores from the North American colonies—and an active trade appears to have been carried on between England and these plantations, and between the latter and the West Indies. A very profitable trade from the North American plantations was carried on with the foreign West Indies, which was most unwisely attempted to be stopped, by British West Indian interests obtaining a British act of parliament, framed in 1733, imposing nearly prohibitive restrictions on that trade, although the proceeds and profits of which were nearly all remitted to England in payment for manufactures. The value of exports from Great Britain to North America, on an average of the three first years of King William's reign, is stated by Chalmers, at 395,619*l*. The imports at 339,138*l*.; the population in 1715, that is 130 years ago, at 375,750 whites; 58,850 negroes. Total 434,600.

That trade was paralysed for some time, but not suppressed. It was beyond the power of mere acts of parliament to annihilate so profitable a commerce: especially that carried on by British merchants, from England, through the North American colonies, to the French and other foreign West Indies, until 1665, when Mr. Grenville, a man of great integrity, but of contracted mind, and a most blundering commercial legislator, converted the gallant commanders of his majesty's ships of war, on the American and West India, as well as on the British coasts, into sworn revenue officers for the enforcement of restrictive navigation.

The profitable trade from the North American plantations in supplying the French, Spanish, and Danish West Indies, with British manufactures and colonial provisions and stores, was consequently, during the following year, almost annihilated by the wicked interference of Mr. Grenville. Grievous, indeed, was the consequent infliction upon British trade and navigation—and unfortunate the effects finally caused by the just, but unredressed, complaints of the North American colonists.* Their grievances were only attended to by an attempt to

* Macgregor's British America.

increase their burdens—by extending to them the Stamp act—which they effectually resisted under the title of “*The folly of England and the ruin of America.*”

In a letter from one of the New England colonists to the Board of Trade and Plantations, printed in the year 1715, concerning the trade, it is asserted, “That one fleet only from New England brought home 6000 barrels of pitch, tar, and turpentine to London. Ships of late we build very well, both for beauty and strength. Even so early as this time, we find our sugar colonies complaining of New England’s great trade to the Dutch colony of Surinam, which they now supply with vast numbers of small horses, and with provisions, fish, &c., and in return took their molasses, which they made into rum.”

In the year 1740, it appears from the information given to the Board of Trade by persons concerned in the two British colonies of Virginia and Maryland, that about 200 British ships were annually and constantly employed in that trade, viz., “about eighty or ninety sail to Virginia, and about 110 to 120 to Maryland; that the ships trading thither from the outports of Great Britain were generally of a lesser burden than were those from the port of London: and that of about 30,000 hogsheads of tobacco, annually imported from those two colonies into Great Britain, 18,000 were brought home in the London ships. Also that this computation was exclusive of the vessels employed by those two colonies in their trade with the other British continental and island colonies of America.”

From the Year 1744 to 1748, inclusive, Exported—			From the Year 1754 to 1758, inclusive, Exported—

* The official values at average prices computed at average prices in the year 1694 are absurdly erroneous: and have been merely returned by the customs, under the supposition that they form the best index as to the relative quantities exported from the United Kingdom. We have arranged the above table as an approximate view of the relative quantities exported to the United States of America.

STATEMENT made to Congress, by the American Government, of the Trade between the United States of America and the United Kingdom.

Value of foreign imports into the port of New York during the year 1844, viz.: free merchandise, 9,716,588 dollars; specie and bullion free, 1,111,364 dollars; dutiable merchandises, 64,921,263 dollars;—duty paid on the latter, 21,457,830 dollars.—Total value of imports, 75,748,720 dollars.

CHAPTER XXIV.

NAVIGATION AND TRADE BETWEEN THE UNITED STATES AND BRITISH POSSESSIONS IN NORTH AMERICA AND THE WEST INDIES.

THE commercial intercourse between the colonies now forming the Atlantic States of America, and the British colonies in the West Indies, was of great value before the declaration of independence.

On the termination of peace this trade might have increased to the reciprocal advantage of the United States and of the British colonies, if the wise policy brought forward by Mr. Pitt, in 1783, had not been thwarted by Lord Sheffield and others, and if the most illiberal orders in council had not been, instead, pro-

mulgated; and which nearly paralysed this trade until somewhat more liberal measures were brought forward in 1830, and legalised in 1831. In respect to the American trade with the West Indies, the ports of the latter were open to United States vessels on the payment of differential duties, from 1795 to 1807.

Incalculably great would have been the navigation and trade, and the consequent bonds of material and peaceful interests, if the maritime and trading intercourse of Great Britain and Ireland, with the whole of Anglo-America, including the United States, British North America, and the British West Indies, had been established upon the free basis of a *general coasting trade*.

From 1795 to 1801, the exports from the United States to the West Indies, and the imports from the latter to the former, were as follow:—

Y E A R S.	Exports.	Imports.	Y E A R S.	Exports.	Imports.
	dollars.	dollars.		dollars.	dollars.
1795.....	2,634,664	6,426,091	1799.....	6,285,254	6,083,372
1796.....	5,446,559	6,301,534	1800.....	6,404,786	5,774,411
1797.....	2,147,025	3,045,045	1801.....	9,699,722	6,968,632
1798.....	4,283,940	2,925,739			

During the years 1802, 1803, and 1804, the value of the exports and imports, according to an estimate made by the secretary of the Treasury, was—

Y E A R S.	Exports.	Imports.
	dollars.	dollars.
1802.....	6,228,464	4,486,890
1803.....	5,624,647	4,492,861
1804.....	6,315,667	4,739,186

The Average Annual Trade of the United States, for Three Years, according to the same authority, was as follows:—

I.—*With the dominions of Great Britain in Europe (Gibraltar excepted).*

The annual exports were estimated at about 15,690,000 dollars, viz.:—

Domestic produce.....	dollars.	dollars.
Cotton	5,640,000	
Tobacco	3,220,000	
Provisions.....	2,160,090	
Lumber, naval stores, and pot ashes	1,510,000	
All other articles of domestic produce.....	900,000	
		13,430,000
Foreign merchandise		2,260,000
		15,690,000

The annual imports, at 27,400,000 dollars, viz.:—

In merchandise paying duties on its value, embracing, with inconsiderable exceptions, all the woollen, cotton, linen, silk, metal, glass, and paper manufactures.....	26,060,000
All the articles paying specific duties, and consisting principally of salt, steel, lead, nails, and porter	1,340,000
	27,400,000

II.—*With the British East Indies.*

Annual exports, viz.:—

Domestic produce	dollars.
Foreign do.	47,000
	83,000
	130,000

Imports, 3,530,000 dollars, viz.:—

In merchandise, paying <i>ad valorem</i> duties, and consisting, principally, of white cottons	dollars.	2,950,000
In all other articles, consisting, principally, of sugar, pepper, and cotton.....		580,000
		3,530,000

III.—*With the Northern British Colonies in America.*

The annual exports amount to 1,000,000 dollars, and consist of the following articles, viz.:—
Domestic produce. dollars. dollars.

Provisions and live stock.....	530,000	
Lumber, naval stores, and pot ashes.....	90,000	
Skins and furs	160,000	
All other articles.....	60,000	
		840,000
Foreign merchandise		160,000

1,000,000

The annual imports amount to 540,000 dollars, viz.:—

In goods paying <i>ad valorem</i> duties, and consisting principally of merchandize for the Indian trade, and of fish	480,000
All articles paying specific duties.....	60,000

540,000*

IV.—*With the British West Indies.*

The exports consisted of the following articles, viz.:—

Provisions and live stock.....	4,720,000
Lumber	990,000
All other articles.....	840,000
	6,050,000

And the imports as follows, viz.:—

Spirits.....	2,460,000
Sugar and coffee.....	1,480,000
All other articles.....	650,000
	4,590,000

Importations from all Parts of the World.

The annual value of imports, calculated on an average of three years..... 75,316,000

Of which the value imported from the dominions of Great Britain amounts to..... 35,970,000

And that imported from all other countries, as follows, viz.:—

From the northern powers, Prussia and Germany.....	7,094,000
From the dominions of Holland, France, Spain, and Italy.....	25,475,000
From the dominions of Portugal.....	1,083,000
From China, and other native powers of Asia.....	4,856,000
From all other countries, including some articles not particularly discriminated.....	888,000
	39,346,000

75,316,000

The value of the several species of merchandise thus imported was arranged as follows, viz.:—

1st. Articles (principally imported from the dominions of Great Britain), viz.:—	
Merchandise paying duties on its value.....	39,489,000
Salt, nails, lead, steel, beer, cheese, shoes, and boots.....	1,917,000
Rum	3,881,000

45,287,000

Of which were imported from the dominions of Great Britain... 33,461,000

And from all other countries

45,287,000

* Not including Plaster of Paris.

2nd. Articles principally imported from other countries, viz. :—	dollars.
Coffee	8,373,000
Sugar.....	7,794,000
Molasses	1,930,000
Cotton, indigo, pepper, and pimento.....	2,257,000
Hemp, soap, candles, and all other articles (wines, teas, gin, and brandy excepted).....	1,600,000
	21,954,000
Of which were imported from the dominions of Great Britain...	2,476,000
And from all other countries.....	19,478,000

21,954,000

3rd. Articles only incidentally imported from Great Britain, viz. :—	
Brandy and Geneva	2,753,000
Wines	2,962,000
Teas	2,360,000
	8,075,009
Of which were the produce of British dominions	33,000
Of all other countries.....	8,042,000

According to Mr. Pitkin—

"In the years 1805, 1806, and 1807, the value of the intercourse was nearly the same as in the three preceding years. The value of the exports, while the ports of these islands were open to American vessels, generally exceeded that of the imports; and as the value of the former was then estimated at the place of exportation, and of the latter at the place of importation, the real difference greatly exceeded that shown by the custom-house books.

"Most of the exports consisted of bulky articles, and the amount of freight and insurance, on some of them, particularly lumber and live-stock, was about equal to the first cost; and the amount of freight and charges of the imports, formed no inconsiderable part of their value, at the place of importation. As American vessels were at that time principally employed in this trade, the profits arising from these sources were chiefly confined to the American merchant and ship-owner. Prior to 1808, a great proportion of American lumber went to these islands. The average quantity of boards and plank, in the years of 1805, 1806, and 1807, was about 40,000,000. In 1802, 1803, and 1804, the value of flour, bread, and biscuit, was about 2,000,000 dollars—of lumber, about 1,000,000 dollars—of beef, pork, bacon, and lard, about 800,000 dollars—and of Indian corn, rye, and Indian meal, about 600,000 dollars. The quantity of rum received in return during the same period, was about 4,000,000 gallons annually, valued at about 2,500,000 dollars."—*Pitkin*.

OFFICIAL Value of Imports and Exports of the United States with the British North American and West Indian Possessions, and all parts of the World, for 1830 and 1840.

C O U N T R I E S.	I M P O R T S.		E X P O R T S.	
	1830	1840	1830	1840
	dollars.	dollars.	dollars.	dollars.
Great Britain	24,519,214	33,137,099	26,329,359	59,317,362
British American Colonies.....	650,303	2,007,767	3,756,373	6,093,250
British West Indies	168,579	1,048,165	1,901	2,965,584
All parts of the world	70,876,920	107,141,519	73,845,508	132,085,946

"During the period that the British West Indian ports were closed against American vessels, an active and profitable trade was carried on by the latter, through neutral ports, with the former.

"The aggregate trade with the British American colonies increased, in the ten years from 1830, from 4,436,676 dollars to 8,601,017 dollars, nearly 100 per cent. The tonnage in that trade increased as follows :—

TONNAGE engaged in the Trade between the United States and the North American Colonies, showing the Increase from 1820.

Y E A R S.	E N T E R E D.		C L E A R E D.	
	American.	Foreign.	American.	Foreign.
	tons.	tons.	tons.	tons.
1820	110,821	405	112,223	3,169
1830	130,527	4,002	117,171	14,267
1840	373,149	387,947	357,073	401,805
Increase from 1830	242,622	383,945	239,902	387,538

VALUE of the Imports and Exports of the United States with the British North American Colonies, distinguishing the Tonnage.

YEARS.	IMPORTS.			EXPORTS.		
	American Vessels.	Foreign Vessels.	TOTAL.	American Vessels.	Foreign Vessels.	TOTAL.
	dollars.	dollars.	dollars.	dollars.	dollars.	dollars.
1834.....	1,103,956	444,774	1,548,733	2,448,356	1,126,914	3,535,276
1840.....	1,431,264	576,503	2,007,767	4,191,649	1,908,352	6,100,005
Increase....	327,308	131,729	459,034	1,743,293	781,438	2,564,729

"The increase of 987,945 foreign tons entered the United States, from 1830 to 1841, was merely nominal, the increased value of business in those tons being but 131,729 dollars. This nominal increase in British colonial tonnage forms sixty per cent of the aggregate increase of foreign tonnage in the whole United States, and deducted therefrom, gives an actual increase of foreign trading tonnage of 220,299 tons, against an increase in the same period of 664,682 in American tonnage. Again, it appears that the aggregate business between the United States, the British West Indies, and American colonies, increased, from 1821 to 1830, 1,936,181 dollars, and in the subsequent ten years, 3,563,311 dollars. Hence it appears that the proclamation issued by General Jackson, by removing restrictions on the trade of the colonies, increased the commerce 1,600,000 dollars per annum, sixty-five per cent of which was enjoyed by American vessels. This does not appear to be an evil so great in its influence upon the whole country as to warrant the return to the prohibitory system previously in operation."—*Hunt's Mercantile Miscellanies*.

A contraband trade between the United States and the British colonies, especially with the North American colonies, is known to be carried on to a very great extent.

STATEMENT of the Tonnage of American Vessels employed in the Trade with the British Possessions, which Entered Inwards and Cleared Outwards, at the Ports of the United States, during the Years 1821, 1831, 1835, and 1841.

TRADE OF THE UNITED STATES WITH THE BRITISH EAST INDIES.

The trade between the United States and the British East Indies, commenced soon after the peace of 1783. In 1788, 1789, Earl Cornwallis, then governor and commander in India, gave orders, that American vessels should be treated at the Company's settlements, in all respects, as the most favoured foreigners; and the ship *Chesapeake*, one of the first vessels that displayed the American flag in the Ganges, was exempted by the supreme council of Bengal from the government customs, which foreign vessels were bound to pay.

This intercourse was regulated by the thirteenth article of the treaty of November 19th, 1794, and by subsequent legislation.—See *Treaties*.

American ships are also allowed to trade and carry merchandise direct from the United Kingdom to British India, and from both to China. The trade to China from British India, since the opening of the ports of the latter, has been commenced by the citizens and ships of the United States.—See *Trade with China*.

The value of the American trade with the British East Indies, from 1795 to 1801, according to Mr. Pitkin, was as follows:—

YEARS.	Imports.	Exports.	YEARS.	Imports.	Exports.
	dollars.	dollars.		dollars.	dollars.
1795.....	742,523		1799.....	1,521,213	
1796.....	2,427,717	66,316	1800.....	3,391,027	7,296
1797.....	1,764,290	21,325	1801.....	5,134,456	130,461
1798.....	2,977,324	39,075			71,617

On an average of the years 1802, 1803, and 1804, the value of the imports was 3,530,000 dollars, and the value of the exports, 130,000 dollars.

From 1821 to 1845, the following was the value of imports and exports:—

YEARS.	IMPORTS.	EXPORTS.		YEARS.	IMPORTS.	EXPORTS.	
		Domestic Pro-duce.	Foreign Pro-duce.			Domestic Pro-duce.	Foreign Pro-duce.
	dollars.	dollars.	dollars.		dollars.	dollars.	dollars.

1832.....	2,538,938	189,218	330,235	1845.....			
1833.....	1,832,059	136,156	188,543				

Prior to the year 1816, much the greatest part of the imports from the British East Indies, consisted of low-priced cotton goods. During the years 1802, 1803, and 1804, the value of these white cottons, imported into the United States, was estimated, on an average, at about 2,950,000 dollars. By the tariff of 1816, all cotton goods, the original cost of which, at the place from whence imported (except nankeens directly from China), was less than twenty-five cents per square

yard, were to be taken and deemed to have cost that sum per square yard, and charged with duty accordingly. This minimum price was fixed for the purpose of excluding entirely from the American market the low-priced Indian cottons, to protect the American planter and manufacturer. But few Indian goods were imported afterwards into the United States, and indigo and silks were the principal articles imported.—See *Tables*, 1790 to 1844, inclusive.

The exports to British India consisted of some flour, whale oil, spermacetti, and tallow candles—manufactured tobacco, timber, &c., and specie—the export of these gradually diminished from 1,930,376 dollars, in 1822, to 98,516 dollars, in 1833.—See *Tables*, 1790 to 1844, inclusive.

CHAPTER XXV.

TRADE BETWEEN THE UNITED STATES AND CHINA.

THE American trade with China commenced soon after the close of the peace of 1783. The first ship, commanded by Captain Green, from the United States, sailed from the port of New York for Canton, on the 22nd of February, 1784, and returned on the 11th of May, 1785.

The success, as well as novelty, of Captain Green's voyage, attracted no little attention in this country; and the second voyage to this distant part of the world was of a more bold and adventurous character.

Captain Stewart Deane, a citizen of Albany, who had successfully commanded a letter of marque in the early part of the war of the revolution, having had a personal interview with Captain Green on the subject of his voyage, resolved to fit out the sloop *Experiment*, of only eighty-four tons, which he had just built at Albany as a coaster, for this distant voyage; and on the 19th of December, 1785, this navigator, with a crew of only seven men and two boys, sailed in this little bark for Canton. Such a distant voyage, in so small a vessel, was, at that time, considered so extremely hazardous, that no insurance could be effected on the vessel and cargo at any of the offices, either in America or England. The sloop arrived safe at Canton, in May, 1786; where she was, at first, mistaken for a tender to some large ship, which had been left below, in Canton river: and the inhabitants were not a little astonished, to learn that this small vessel, with her Atlantic, Indian, and Chinese crew, had crossed the ocean from the opposite hemisphere:

This daring enterprise insured him, Captain Deane, a hospitable reception at Canton, and particularly at the British factory.

He returned to America in 1787, and was afterwards, for some years, engaged in the same trade, as commander of much larger vessels.

These two first and successful voyages induced others to engage in the trade; and as early as 1789, fifteen American flags arrived at the port of Canton, a greater number than from any other nation, except Great Britain.*

The principal articles imported into the United States from China, have been teas, silks, nankeens, and china-ware. During the late wars in Europe, the Americans, not only supplied their own country, with the article of tea, but shipped large quantities of it to different parts of Europe, to supply the wants of the belligerent nations, who were dependent on neutrals for this, as well as many other necessary foreign articles.

The American trade with China may be divided into that which is *direct* from the United States, and that which is carried on generally, on American account, and embracing not only that between the United States and China, but that also carried on by the Americans between China and other parts of the world.

The amount of the commerce of the United States with China is next to that of Great Britain. And the former, by the ancient British treaty, enjoy all the privileges of the British; and the Americans have also since negotiated a treaty of commerce and navigation.

The following is a statement of the quantities of the several kinds of teas, paying duties (the exports being deducted from the imports), for each year from 1790 to 1800:—

Y E A R S.	Bohea.	Souchong.	Hyson.	Other Green.	TOTAL.
	lbs.	lbs.	lbs.	lbs.	lbs.
1790.....	2,050,684	368,075	530,613	88,870	3,047,242
1791.....	774,008	91,123	107,934	12,932	985,997

Making an average annual consumption of about 3,350,000 pounds.

* Macpherson's Annals of Commerce.

From 1821 to 1833 we include the *value*, as estimated at Canton, as well as the *quantity* of teas imported and exported, in each year, during this period; and it will be remembered, that the value is estimated at Canton.

QUANTITY REMAINING ON HAND.—CONSUMPTION.

During the period from 1821 to 1832, the quantities remaining on hand at the end of each year, amounted to 74,914,761 lbs., or an average of 6,242,897 lbs. annually; and from 1833 to 1841, to 114,944,356 lbs., or 12,771,594 lbs. annually—showing a considerable increased consumption, as will appear further by the following statement:—

	lbs.	lbs.
Assuming that the balance on hand at the close of 1820 (for we have no actual data prior to 1821), to be the same as at the end of 1821....		4,586,223
The imports from 1821 to 1832 were		92,982,768
		97,568,991

Value of Teas.....				42,290,053	
Value of rest of cargoes..				13,600,446	

The value of Teas imported, therefore, appears to be annually about 4,698,894 dollars, and to constitute rather exceeding 75 per cent of the value of the whole cargoes;—which have averaged since 1834, 177,430 dollars each. The trade has employed yearly about thirty-five vessels, averaging 390 tons, with crews of eighteen men and boys.

* Merchandise only.

We have not been able to procure any returns upon which any reliance can be placed for the blank years in the above table. The returns for 1844 we have received from the British consul at Canton.—See his detailed statement of the American trade at Canton for that year hereafter: which, with other returns of the British and foreign trade of that port, has been prepared with great pains and all possible accuracy by him.

Formerly large quantities of valuable furs, procured on the north-west coast of America, and of seal-skins, obtained from the numerous islands in the high latitudes of the southern ocean, were carried to China; and furnished no inconsiderable part of the American sales in the China market; but which never appeared in the American custom-house documents, or constituted any part of the official exports of the United States.

The great prices obtained at Canton for furs, particularly sea-otter skins, from the north-west coast of America, carried there by Captain Cook, induced others to engage in this trade. The enterprise of the Americans led them very early to engage in these long and hazardous trading voyages. The first undertaken, from the United States, was in a ship belonging to Boston, under the command of Captain Kendrick; and the discoveries made by this ship, along the north-west coast of this country, were afterwards urged, by the United States, in support of their claims in that quarter. These voyages, at first, afforded large profits, from the number of the skins procured, and which found a ready market at Canton. The quantity of these furs, for many years past, has greatly diminished, and this trade has become of comparatively small importance.

The Americans not only explored the north-west part of this continent for furs, but also visited the numerous islands in the southern ocean, in search of seal-skins, for the Chinese market. These latter voyages being at first also profitable, induced such competition, that the seal soon became scarce at the places usually visited. The Americans, however, with a spirit of enterprise and hardihood only equalled by those who pursue the whale, pushed their way through floating mountains of ice to still higher southern latitudes; and found the *fur-seal*

in islands and regions before unknown. These perilous voyages were principally conducted by the hardy and adventurous fishermen of Stonington, in Connecticut, in vessels of from fifty to eighty tons. In June, 1833, the number of schooners employed in sealing, from Stonington and its vicinity, was twelve, whose aggregate tonnage was only 855 tons; averaging about seventy for each vessel, and manned by 202 men.—*Pitkin's Statistics*.

We have no official documents showing the value of the furs thus procured by the Americans for the Chinese market. An American gentleman, who was for some time consul at Canton, furnished Mr. Pitkin with a statement of the number and value of sea-otter and seal-skins, imported into Canton, in American vessels, from June, 1800, to January, 1803, with the number of American vessels, entering the port of Canton, during the same period, and the value of exports, for each year, from June 11, 1800, to June, 1802.

According to this statement, the number of sea-otter and seal-skins brought to Canton by the Americans, was as follows:—

D A T E S.	S E A O T T E R.		S E A L S K I N S.	
	Number.	Value.	Number.	Value.
From June 11th, 1800, to April 27th, 1801.....	6,450	dollars. 123,050	325,000	dollars. 276,283
From May 15th, 1801, to June, 1802	14,187	298,263	426,750	393,395
From June, 1802, to January 9th, 1803.....	13,720	274,000	297,000	237,600
	34,357	695,313	1,048,750	907,278

The number of American vessels, entering the port of Canton, during the first period, was thirty-three; of which seven were from Boston, seven from Philadelphia, and all the otter-skins were brought in the vessels from the former. The number of vessels in the second period was thirty-four—fourteen from Boston, and nine from Philadelphia; and in the third, the number was thirty-three—eleven from the former place, and six from the latter; and in the two last periods, most of the otters were also brought by the Boston vessels.

According to the same statement, the exports to the United States were:—

	dollars.
For the first period	2,522,000
„ „ second period	3,742,194

Averaging those two years about 3,200,000 dollars; and the value of skins imported during the same periods, was about 1,080,000 dollars; equal to about one-sixth of the exports. Mr. Pitkin could obtain no information, as to the value of furs and skins carried to Canton, from 1803 to 1818.

About the year 1819, the American merchants began to carry British woollen and cotton goods, from the ports of Great Britain, directly to China. The value of British goods, imported into Canton by the American merchants, 1824—1825, was 794,514 dollars; and in 1826—1827, was 893,836 dollars.

The merchandise thus exported, from Great Britain, does not appear in the

American custom-house books; and makes no part of the official accounts of American exports to China. This trade has been continued.

RETURN of the Quantities and Value of Merchandise Exported from the Port of Canton, in forty-three American Vessels, of the burden of 19,269 Tons, to the Countries and Places undermentioned, during the Year ending 31st of December, 1844, viz:—

N.B.—In these returns are not included the quantities of merchandise imported into Canton *viâ* Macao, in Portuguese Lorchas.

Canton, 31st of December, 1844.

FRANCIS C. MACGREGOR,
Her Majesty's Consul.

CHAPTER XXVI.

TRADE AND NAVIGATION BETWEEN THE UNITED STATES AND THE FOREIGN WEST INDIES, MEXICO, CENTRAL AMERICA, AND THE STATES OF SOUTH AMERICA.

In defiance of the suicidal commercial policy of France, Spain, and Portugal, which prohibited any legal trade or intercourse on the part of foreign subjects or citizens, with their possessions on the continent of America and the West India Islands, the Anglo-Americans persevered and succeeded, during war and peace,

in supplying with provisions and merchandise, the French, Spanish, and Portuguese colonies.

In some instances, France allowed her colonies to receive foreign articles, which could not be supplied by the mother country; and those legal imports into the French colonies, from the United States, amounted in 1786, to 13,263,000 livres, or about (at the then value of French money in the West Indies) 520,000*l.* sterling. Imports by American ships from these colonies, amounted to about 7,263,000 livres. The extent and value of the illicit trade has at all times been uncertain.

At the commencement of the late war, declared by France against Great Britain, in the winter of 1793, France offered to secure to the United States, the trade of her colonies by a *national compact*; accompanied by a new treaty of alliance, under which the French colonies were to be afterwards ceded to France. The American government did not consider it politic to accept the offer.

During the war, however, France was compelled to leave open her colonial ports to all the world; and the Americans had a principal share in the trade with the French West India islands. The value of exports and imports, in each year, from 1795 to 1801, are stated as follows by Mr. Pitkin:—

Years.	Exports.	Imports.	Years.	Exports.	Imports.
	dollars.	dollars.		dollars.	dollars.
1795	4,954,952	15,751,758	1799	2,776,604	2,022,929
1796	8,408,946	15,743,774	1800	5,123,433	9,385,111
1797	8,565,053	14,030,337	1801	7,147,972	13,593,255
1798	5,344,690	15,380,091			

During the years 1804, 1805, 1806, and 1807, the average value of American domestic produce, carried to the French islands, was about 2,800,000 dollars, and of foreign produce, between 3,000,000 dollars and 4,000,000 dollars. The imports from them into the United States, during this period, were to a much larger amount: the greatest part of the imports were afterwards re-exported to France and other parts of Europe. After that period, most of the French West India islands were captured by the British.

On the restoration of peace, in 1814, France resumed her former system of colonial policy; but the value of the commercial intercourse of the United States, with the islands remaining, after the loss of St. Domingo, had been comparatively of little importance.—(See *Tables of the Trade of the United States, &c.*)

HAYTI.—The American trade with the island of Hayti, since it came under the government of the blacks, has been continued: and since 1821, has far exceeded that with the islands still remaining in the possession of France. The principal articles exported to Hayti, are flour, rice, beef, pork, butter, lard, hams, cheese, and fish; and coffee and cocoa are the chief articles received in return.—(See *Tables* hereafter.)

American Trade with Spanish West Indies and American Colonies.—During the long wars in Europe, the Americans were the principal carriers of the rich products of the Spanish islands, and, to a great extent, supplied those islands also with the manufactures of Europe. The values of exports and imports, from 1795 to 1801, were as follows :—

Years.	Exports.	Imports.	Years.	Exports.	Imports.
	dollars.	dollars.		dollars.	dollars.
1795	1,389,219	1,739,138	1799	8,993,401	10,974,295
1796	1,821,347	1,718,026	1800	8,270,400	10,587,566
1797	3,595,519	4,123,362	1801	8,437,659	12,799,878
1798	5,082,127	8,139,167			

The exports of domestic and foreign produce to the Spanish colonies, from 1804 to 1820, were estimated as follows :—

Years.	Domestic Produce.	Foreign Produce.	Years.	Domestic Produce.	Foreign Produce.
	dollars.	dollars.		dollars.	dollars.
1804	1,725,662	1,176,998	1813	2,809,705	183,549
1805	2,806,112	4,884,776	1814	1,971,886	48,408
1806	2,391,172	8,476,061	1815	2,832,828	866,048
1807	2,470,472	9,870,753	1816	2,732,226	3,048,386
1808	631,086	3,545,967	1817	3,606,588	3,477,511
1809	3,352,271	3,333,346	1818	3,531,769	2,380,464
1810	3,182,318	3,604,791	1819	3,519,366	2,980,717
1811	3,606,510	3,973,099	1820	3,439,365	2,545,717
1812	2,640,502	1,331,638			

The trade of the United States with Cuba has been of considerable extent, the exports consist of quantities of flour, also beef, pork, dried fish, and lard. American manufactures, such as household furniture, coaches and carriages of different sorts, saddlery, hats, combs, buttons, gunpowder, glass, leather, boots and shoes, soap, and tallow candles, together with spermaceti, and several minor articles. In return for these, the imports are sugar, nearly one-half of that which is imported into the United States from all parts of the world has been received from that island, and from the same source we have received more than one-third of our coffee. With other parts of the Spanish West Indies, with Mexico, the Central Republic, Columbia, Buenos Ayres, Chili, and Peru, the American trade has been, and is, of considerable importance; Mexico, the Central Republic, Columbia, Brazil, Buenos Ayres, and Chili, are markets for domestic produce, manufactures of cotton, &c. The exports to Brazil of American domestic produce, consist of, viz.: flour, fish, beef, pork, hams, and butter, candles of spermaceti and tallow, whale oil, household furniture, hats, shoes, and boots, soap, cotton goods, and gunpowder; and also foreign articles, such as cotton and hempen goods, sail duck, cordage, teas, and spices; the American ships bringing back copper and raw hides, sugar, coffee, as well as gold and silver coin.

Subsequent to 1820, a separate account of the commerce with the island of Cuba, has been kept by the United States customs; together with the quantity of sugar, coffee, and molasses, imported in each year, since that period, viz. :—

Years.	Imports.	Exports.	Years.	Imports.	Exports.
	dollars.	dollars.		dollars.	dollars.
1821	6,584,849	4,540,680	1833	9,754,787	5,672,700

1829	4,866,524	5,578,889	1841	11,567,027	5,739,082
1830	5,577,230	4,916,735	1842	7,650,429	4,770,449
1831	8,371,797	4,893,842	1843	3,326,797	5,015,933
1832	7,068,857	5,312,151	1844	5,238,595	9,930,421

The following quantities of sugar, coffee, and molasses, have been imported from Cuba into the United States, during the following years.

Years.	Brown Sugar.	White or Clayed Sugar.	Coffee.	Molasses.
	lbs.	lbs.	lbs.	gallons.
1821	29,651,810	6,165,645	9,113,866	4,738,156
1825	31,387,099	6,914,813	19,167,025	6,214,367
1831	39,363,080	10,326,218	38,097,122	10,449,437
1840	48,126,706	12,967,463	25,331,888	15,377,778
1841	90,384,397	15,215,291	17,198,573	15,694,753
1842	67,586,332	15,224,332	14,321,458	13,526,616
1843	31,628,319	1,076,449	16,611,987	98,715,755
1844	114,362,368	4,720,678	18,628,875	194,059,165

The principal articles of domestic produce usually shipped from the United States to Cuba, are flour, fish, beef, pork, hams, lard, butter, rice, lumber, whale oil, and various domestic manufactures, as household furniture, coaches, and other carriages, hats, saddlery, glass, gunpowder, combs, and buttons, leather, boots and shoes, spermaceti and tallow candles, and soap; and of foreign produce, cotton, silk, flax and hempen goods, some wines, teas, spices, &c.

Quantity of flour, beef, pork, dried fish, and lard, exported to Cuba during the following years :—

Years.	Flour.	Beef.	Pork.	Dried Fish.	Lard.
	barrels.	barrels.	barrels.	quintals.	lbs.
1821	156,071	12,364	8,509	41,614	2,398,259
1825	109,698	13,170	1,410	51,280	3,274,107
1830	77,598	9,794	9,706	73,948	4,609,493
1840	69,819	4,029	3,628	69,018	5,539,245
1841	69,337	6,271	4,436	77,219	7,358,111
1842	46,846	6,286	4,146	86,110	5,318,875
1843	29,437	3,203	3,352	46,307	4,400,122
1844	24,875	7,800	6,164	107,493	6,390,873

The value of the following domestic manufactures, exported to Cuba, in the year 1830, was estimated at more than 800,000 dollars, viz.:—in

Household furniture	58,673
Coaches, and other carriages	16,945
Hats	182,216
Saddlery	21,961
Glass	20,688
Gunpowder	62,722
Combs and buttons	33,738
Leather, boots and shoes	157,738
Soap, and tallow candles	217,990
Spermaceti candles	62,413
Total	835,084

The American tonnage, employed in the trade with Cuba, since 1821, has varied from about 100,000 to 130,000 tons in each year (including the repeated voyages), and with the port of Havanna has, in some years, far exceeded that of all other nations.

In 1827, the number of vessels entering and clearing from this port, with their tonnage, was as follows:—

COUNTRIES.	ENTERED.		CLEARED.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
	number.	tons.	number.	tons.
United States	785	125,087	667	103,395

Sicily	1	247		
Prussia	1	224		
Total, 1827.....	1053	169,281	916	147,731
„ 1843.....	1455		1450	
„ 1844.....	1678		1638	

The quantity of sugar and coffee imported into the United States, since 1821, from this island, has been, of the former, nearly one-half, and of the latter, from one-third to one-half of all those articles imported, from all parts of the world during this period.

The following statement exhibits the proportions of imports during the Year ending the 30th of June, 1844.

FROM	Total Imports.	In American Vessels.	In Foreign Vessels.	Total from Spanish Dominions.
Spain on the Atlantic.....	252,127	214,294	37,833	} 13,775,451
Spain on the Mediterranean	381,237	322,491	58,746	
Teneriffe.....	61,653	52,050	9,603	
Manilla.....	724,811	724,811		
Cuba.....	9,930,421	9,823,521	106,900	
Other Spanish West Indies.	2,425,202	2,395,185	30,017	

See tables of exports to foreign West Indies and South America, &c., hereafter.

Porto Rico.—In an official document, published at Porto Rico, the general trade, in 1842, was stated as follows:—

From the above-mentioned documents, I find that the total importations for that year amounted to dollars cts.
5,757,403 84

	dollars	cts.
Of which were imported in Spanish bottoms	3,410,577	57
In American bottoms	1,456,998	05
In French bottoms	151,371	12
In English bottoms	139,502	57
In all other foreign bottoms	598,954	53
	5,757,403	84

That the total exportations for the same year amounted to	6,429,257	35
Of which were exported in Spanish bottoms	1,563,109	19
In American bottoms	2,453,299	32
In French bottoms	911,138	31
In English bottoms	554,126	88
In all other foreign bottoms	947,583	65
	6,429,257	35

That the number of vessels "arriving" and "departing" are:—

	Arrivals.	Departures.
Spanish vessels	594	509
American vessels	438	399
French vessels	143	137
English vessels	88	91
All other foreign vessels	85	81
	1348	1217

That the commercial revenue is this:—

	dollars	cts.
Amount of duties collected on imports	1,026,266	95
" " " exports	313,201	25
" " " tonnage and anchorage dues	98,882	98
	1,438,351	18

TOTAL Exports to the following Countries, since their Independence as separate Governments.

Y E A R S .	Mexico.	Venezuela, New Granada, and Peru.	Central America	Brazil.	Argentine and Cisplatine Republics.	Chili.	Hayti.

CHAPTER XXVII.

TRADE OF THE UNITED STATES WITH FRANCE.

THE trade between France and the United States, in 1787, was, according to M. Peuchet, as follows:—

Exports to the United States, from France and dependencies.

	livres.
Coffee, sugar, rum, syrup, salt, olive oil, fruits, brandy, wine, and liqueurs, amounted to	10,675,000
Cotton, drugs, &c., to	694,000
Stuffs, laces, silk, hosiery, linen, cambric, soap, gloves, gunpowder, glassware, and hardware, to	1,238,000
	12,607,000
Or about 2,500,000 dollars.	
	livres.
Grain, fish, and bread stuffs, amounted to	4,483,000
Boards, timber, staves, live stock, fish oil, peltry, pitch and tar, potash, linseed, and tobacco, to	19,283,000
Manufactures, introduced into the colonies, to	547,000
Negroes	226,000
	24,539,000

Or about 5,000,000 dollars.

For about three years preceding the French Revolution, the average value of imports from the United States into France alone, was estimated at 9,600,000 livres, or about 1,520,000 dollars; and the exports from France to the United States, at 1,800,000 livres, or about 380,000 dollars.*

In 1792, according to the statement of the secretary of state, the exports to France and dependencies amounted to 4,698,735 dollars, and the imports to 2,068,348 dollars.

The articles of domestic produce usually shipped to France, are cotton, tobacco, hops, some fish, pot and pearl ashes, whale oil and whalebone; and those of foreign produce, principally sugar and coffee, with some teas, cocoa, pepper, and other spices. The principal imports are wines, brandy, silks, olive oil, and jewellery of all kinds; and, latterly, cotton goods.

STATEMENT of the Value of Exports and Imports, from 1795 to 1801.

Years.	Exports.	Imports.	Years.	Exports.	Imports.
	dollars.	dollars.		dollars.	dollars.
1795	7,698,683	3,671,331	1799		901,018
1796	3,171,759	1,835,066	1800	40,400	74,228
1797	3,825,231	3,045,796	1801	3,985,292	1,013,690
1798	1,476,588	1,371,727			

* The small amount of this commercial intercourse, particularly in exports, disappointed the expectations of the French nation, and Monsieur Arnould, referring to this balance against France, says—"Voilà donc pour France le *ne plus ultra* d'un commerce, dont l'espoir a pu contribuer, à faire sacrifier quelques centaines de millions, et plusieurs générations d'hommes."

VALUE of Domestic and Foreign Produce, Exported to France from 1804 to 1820.

Years.	Domestic Produce.	Foreign Produce.	Years.	Domestic Produce.	Foreign Produce.
	dollars.	dollars.		dollars.	dollars.
1804	3,219,112	5,604,942	1813	1,780,291	2,296,453
1805	3,079,862	9,885,602	1814	286,429	30,018
1806	3,226,698	8,197,694	1815	5,033,084	1,853,859
1807	2,715,141	10,315,678	1816	7,352,676	2,222,660
1808	708,670	2,126,396	1817	7,114,535	1,695,232
1809			1818	8,719,445	3,346,577
1810	16,782	1,672	1819	6,612,499	2,729,549

TRADE BETWEEN THE UNITED STATES AND THE CONTINENTAL PORTS OF EUROPE
(EXCLUSIVE OF FRANCE).

The trade carried on by American ships and citizens with the ports of continental Europe, exclusive of France, has been of important extent. To **HAMBURGH** and **BREMEN**, the value of exports of the United States, consisting chiefly of tobacco, cotton, wool, rice, rum, whale oil, skins, furs, pot and pearl ashes, coffee, sugar, teas, cocoa, pepper, and other spices, will be found in the foregoing and following tables of the general trade of the United States.

To **HOLLAND**, the exports are nearly of a similar kind, and from the Hanse Towns, and from Holland, manufactures are imported into the United States, or carried by American ships to the foreign markets.

The trade from the United States to the ports of the Mediterranean, consists chiefly in the exports of cotton, sugar, fish, whale oil, &c., to Trieste and the Italian ports; and carrying away wines and some manufactured goods. Some trade is also carried on by the United States' ships with Turkey, the coasts of Africa, and Asia within the Mediterranean.

To **RUSSIA**, the exports from the United States have been unimportant, consisting chiefly of some cotton, tobacco, rice, and oak-bark, of our domestic produce, and coffee, sugar, spices, and dye-woods, being the articles of foreign produce mainly exported. The imports from Russia have been of great amount and value (see *Tables*), principally of iron, hemp, cordage, duck, various species of cloth wrought from hemp and flax, such as shirtings, tickings, both broad and narrow, drillings, and diapers. With **SWEDEN**, the trade of the United States has been inconsiderable; iron formerly constituting the principal import to this country, for which were returned tobacco, rice, whale oil, and other articles of domestic as well as foreign produce. **DENMARK** also ranks low in the amount of its commercial intercourse with the United States.

The trade between the United States and **SPAIN** has been greatly restricted by the pernicious prohibitory and high customs duties of the latter. Cotton and some articles are exported in return for wines, &c., from the United States.

To **PORTUGAL** and **MADEIRA**, the United States have exported some wheat, maize, flour, fish and fish oil, staves, &c., in return for wines, salt, fruit, &c.—For details, see the *Tables of Trade generally*.

CLASSIFIED Summary of the Value of Merchandise Imported into the United States, from the following European Countries, during the Year ending the 30th of June, 1844.

Price of passage, including provisions, 23 dollars 50 cents.

Of the 624 bottoms employed in carrying the foregoing produce of the United States, 414 were American, 147 Hanseatic, twenty-seven French, twenty-two Swedish and Norwegian, eight English, five Hanoverian, four Belgian, four Dutch, two Prussian, and one Danish.

The sales of tobacco at the five ports on the North Sea, amounted, in 1843, to 68,970 hogsheads; less by 13,015 hogsheads, than in 1842. Prices in 1842 ruled so low, compared with former years, that the trade overstocked itself.

RECAPITULATION of the Export of Flour from the United States, for Eleven Years, distinguishing the Countries to which Exported.

These prices, at many points, are affected by the depreciated nature of the currency; at Mobile, for instance, the currency is depreciated forty per cent, and prices rule nearly as much higher than at New Orleans, as the difference in the depreciation of the local currencies. Many articles, however (that of flour in particular, which is from three dollars fifty cents at one point, to nine dollars at another), display a much greater disparity in price than the cost of transportation added to the difference in the currencies.

STATEMENT of the Prices of Flour and Wheat at Cincinnati, from 1841 to 1845.

									60 to
									65 " 70

" In the year 1841, the crop of wheat was simply a good one. The average price of flour during the month of July, was four dollars six cents and a quarter per barrel—the average price of wheat, seventy-two cents and a half per bushel. The price of one bushel of wheat, therefore, entered five and three-fifth times into the price of one barrel of flour. By the close of August, flour had advanced to four dollars sixty-two cents per barrel. Wheat remained at seventy-five cents per bushel.

" In 1842, the crop was large. The average price of flour in July, was three dollars forty-nine cents and three-quarters per barrel—the average price of wheat, forty-nine cents and a half per bushel. The price of a bushel of wheat entered seven and one-tenth times into the price of a barrel of flour. By the close of August, flour had receded to two dollars sixty-two cents and a half, and wheat to forty cents to forty-five cents.

" In 1843, the yield proved to be full an average one, and with it there was much of the previous year's crop held over. The average price of flour in July was three dollars seventy-three cents; that of wheat, seventy cents. The price of a bushel of wheat entered five and one-third times into the price of a barrel of flour. The latter part of August, flour stood at three dollars sixty cents to three dollars seventy-three cents; while wheat had fallen to sixty-five cents.

" In 1844, there was a fair crop. For the month of July, flour averaged three dollars twenty-nine cents per barrel, and wheat fifty-nine cents per bushel. The price of a bushel of wheat entered five and three-fifth times into the price of a barrel of flour. By the close of August, flour had advanced to three dollars sixty-five cents to three dollars seventy-six cents per barrel, and wheat to seventy cents per bushel.

" This year, 1845, Ohio had the best yield of wheat that has been given her since 1839.

" The regular proportion of wheat to flour is five bushels to one barrel. On the supposition that this is adhered to in grinding, and not taking offal into the account, the miller has received for his labour and profits, for the five seasons named, as follows :—

	1841	1842	1843	1844	1845
Per barrel.	43½ cents.	102½ cents.	23 cents.	34 cents.	5½ cents.

CHAPTER XXIX.

MISCELLANEOUS STATEMENTS RELATIVE TO MINERALS, CANALS, RAILROADS,
TRADE, SEA-PORTS, PORT AND OTHER CHARGES.*

Copper Region of Lake Superior.—It would appear, if the various accounts we have read have any truth, that the country south of Lake Superior is abundantly rich in copper. One writer states—"The scientific reader is familiar with the history of the famous Copper Rock of Lake Superior. It is a vast mass of solid copper, weighing not less than 6000 lbs., and was discovered, many years since, lying in the bed of the Ontonagon river, entirely isolated. It has rested, probably, for ages some twenty miles from the lake. For the purpose of transporting the mass to navigable water, a huge car, placed upon a moveable railroad, was built, and, by patient labour, it was gradually advanced, until it reached deep water, where it was placed on a flat, and easily floated down to the lake shore. It was intended to ship it to New Orleans. Had they succeeded, it would have been a fortune for them, as a mere curiosity. But government interfered! Although they had purchased the rock from the Indians in whose territory it was found, the government agent claimed its possession—denying the power of the Indians to dispose of it. As this claim was not set up until the great labour of transporting it to the shore of the lake was effected, the agent offered to fully compensate the enterprising gentlemen by whom it had been removed, for their trouble. This was hard, but there was no alternative. They had to submit quietly, and see the fruit of their labours borne off by the government agent to the Sault, from whence it has been shipped on board of a revenue cutter. It will be immediately forwarded to Washington, and placed in the National Institute, where it will remain for all coming time, we hope, as one of the greatest curiosities of the age. The Indians have revealed to Mr. Ashman where another rock (but not of equal weight) may be found. It had been discovered ages before, and hid—its location being kept a profound secret, until civilisation had dissipated the superstition connected with it."

The following letter from a gentleman at Detroit furnishes more detailed particulars of this mineral curiosity:—

"It is upwards of twenty-three years since I first visited this remarkable specimen of native copper in the forests of Lake Superior. It has been somewhat diminished in size and weight, in the mean time, by visitors and travellers in that remote quarter; but retains, very well, its original character and general features. I have just returned from a re-examination of it in a store, in one of the main streets of this city, where it has been deposited by the present proprietor, who designs to exhibit it to the curious. Its greatest length is four feet six inches; its greatest width about four feet, its maximum thickness eighteen inches. These are rough measurements with the rule. It is almost entirely composed of malleable copper, and bears striking marks of the visits formerly paid to it, in the evidence of portions which have from time to time been cut off. There are no scales in the city large enough, or other means of ascertaining its precise weight, and of thus terminating the uncertainty arising from the several estimates heretofore made. It has been generally estimated here, since its arrival, to weigh between 6000 lbs. and 7000 lbs., or about three tons and a half, and is by far the largest known and described specimen of native copper on the globe. It is clearly a boulder, and bears marks of attrition from the action of the water, on some parts of its rocky surface as well as the metallic portions. The adhering rock, of which there is less now than in 1820, is apparently serpentine, in some parts steatitic, whereas the copper ores of Keweenaw point, on that lake, are found exclusively in the amygdaloids and greenstones of the trap formation. A circular depression of opaque crystalline quartz, in the form of a semi-geode, exists in one face of it; other parts of the mass disclose the same mineral. Probably 300 lbs. of the metal have been hacked off or detached by steel chisels since it has been known to the whites, most of this within late years."

A gentleman, who recently (1845) visited Kee-nee-naw Point, the famous location of the Lake Superior Copper Mining Company, in a letter to the editors of the *New York Commercial*, dated at St. Marie, says:—

* The following miscellaneous statements we have procured from the United States since the respective heads, to which they belong, were printed. We introduce them here to complete the commercial statistics of the United States.

"This location is situated to the west of Fort Wilkins about eighteen or twenty miles, through which runs, north and south, the Eagle river. This company have now in operation three shafts. The first is seventy-four feet deep, and the vein twenty-three feet wide. The second is thirty-five feet deep, and the vein twenty-two feet wide. The third is thirty-one feet deep, and the vein six feet wide; and each of these three veins exceeds two miles and a half in length. The veins are all within half a mile of each other, and produce silver and copper, averaging from sixty to seventy per cent. They have now on hand, thrown up from the shafts, some 400 tons, which will be ready for shipment to the Boston market by the 1st of September next. Colonel Gratiot has under him nearly 125 men, who are now busily engaged in erecting pounders and crushers, under which passes the trap rock, in which the ore is found. The ore, after this process, is taken and washed in large wire sieves, which separates the rock from the metal. It is then dried, and put into kegs weighing from 300 lbs. to 500 lbs., and ready for market."

The *Wisconsin Democrat* adds, that,

"If report be true, copper rocks will ere long cease to be a curiosity. Mr. De Garmo Jones, of Detroit, who passed through this place on his way to Mineral point and Platteville, informed us that another mass of copper, much larger and purer than that obtained from the Ontanagon, had recently been discovered. In regard to the prospects of those who are prosecuting their researches after copper ore on the south shore of Lake Superior, Colonel Jones informs us that they are pretty fair."

"*Mineral Resources of Alabama.*—The mineral resources in Alabama are of great variety and abundance, but as yet undeveloped. From the report of the committee on agriculture, at the late session of the legislature, we learn that there are five principal, and several other minor mines of gold and silver in Randolph county, producing about 125,000 dollars annually, and affording employment to 300 or 500 persons. In the same county, are inexhaustible beds of iron ore, which does not lose twenty-five per cent in smelting. Tallapoosa, too, is rich in gold and silver mines, and they afford employment to several hundred hands. Goldville is supported by one mine. Gold, too, has been found in Coosa, Talladega, and Chambers. There are iron-foundries in Benton and Talladega. No doubt, were this rich mineral region examined by a scientific person, many valuable discoveries might be made. In Blount, nitre is found in abundance. This side of Tuscaloosa, coal is found in immense quantities, and in many other places. In Clarke, salt can be manufactured at or near Jackson. Iron ore, marble, granite, limestone, &c., are also found in this country. Lead ore, in large quantities, and of excellent quality, is found in the bed of the Tennessee, on the Muscle Shoals; and all these, and others, exist in many other sections of the state."

—*Hunt's Merchants' Magazine.*

"*Arkansas Coal.*—The Arkansas Coal company are doing a profitable business in anthracite coal. They anticipate the shipment this year (1844) of 150,000 dollars' worth of coal to the numerous cities and towns on the Mississippi. The coal from the Spadra mines is of the anthracite species, burns freely, with no unpleasant smell, and makes but little dust or ashes. 'The mining company,' says the *Arkansas Gazette*, 'have entered into the matter with great spirit, and we predict that the day is not far distant when all the cities, towns, and villages, on the banks of the 'great father of waters' will receive their supplies of coal from the state of Arkansas.'"

"*Kenner Coal.*—The *Pittsburg American* states that Messrs. Reynolds and Shunk, who are building a furnace on Red Bank creek, near the Alleghany river, have discovered, in the immediate vicinity of their works, one of the largest bodies of this kind of coal that is known in our country. A friend describes it as lying in a solid body, and opening on the breast of the hill, fourteen feet in depth. This description of coal, from being free from sulphur, which is never the case with bituminous or anthracite, will, we have no doubt, be capable of being converted to great and important uses in the manufacturing of iron. The discovery of a mineral of this description is of very great value. It has heretofore been found in small veins, but this is the first discovery that has been made of so large and valuable a body."

LAKE TRADE, &c.—*Cost of Transportation on Canals, Railroads, &c.*—Statement made by Mr. Charles Ellet, jun., chief engineer on the James river and Kanawha canal and railroad:—Cost of freight on canals exclusive of tolls, one and a half cent per ton per mile; railroads, two and a half cents; McAdam roads, ten to fifteen cents; common turnpikes, fifteen to twenty cents; steamboats on the lakes, two to four cents per ton per mile; steamboats on the Ohio and Mississippi rivers, half to one and a half cent; future average, three-quarters cent per ton per mile.

One-half the quantity of flour which arrived at tide-water, came from other states; and a large quantity of wheat also came, which was ground in the flouring-mills of New York. Of 2,222,204 barrels of flour which arrived at the Hudson, 1,484,900 barrels were of western produce.

VEGETABLE Food (chiefly Wheat, Flour, Indian Corn, &c.), Imported into New York ;
Total moving on all the Canals, and arrived at Tide-water.

"The internal trade of the state has greatly increased in the last two years—that is to say, the quantity of vegetable food moving on all the canals increased, in 1842, but 12,000 tons; while the quantity coming from other states increased 18,000 tons, and the surplus delivered at tide-water increased 29,000 tons—showing that New York furnished 16,000 tons of the increase of vegetable food delivered at tide-water. In 1843, however, the reverse took place; and the movement on all the canals was raised 44,000 tons over the previous year, while the deliveries at tide-water rose but 37,000 tons. In 1844, an increase of 46,000 tons in the whole movement, and of 35,000 tons only, in the deliveries; showing that the internal receipts and deliveries increased thirty per cent more than the external trade. How far this effect has been produced by the carrying of freights upon the railroads, cannot, perhaps, easily be determined. It is, no doubt, true, that considerable quantities were taken off the canals by the railroads, and they would swell the sum of the internal trade without appearing in the deliveries at tide-water. The changing current of the trade is also apparent in the significant fact that the tonnage at Buffalo actually decreased, while that at Oswego increased seventy per cent, and at Whitehall fifty per cent. In those figures, we have doubtless the influence of the *Welland canal* upon the course of the western trade. Western vessels, coming through the Welland canal, deliver their freights at Oswego, 120 miles in the rear of Buffalo; by which means, that distance of canal tolls is saved. The sagacity of New England capitalists has already detected the route by which the western produce may reach Boston without incurring the tolls levied by the New York canals. The Boston and Burlington railroad, and the Champlain and Ogdensburgh railroads, are in active progress. By this means, the flank of New York will be completely turned. Vessels laden with the produce of the western lakes may avoid New York canals, by passing the Welland without breaking bulk, and delivering their freight at Ogdensburgh; whence, accumulating the products of northern New York, it may pass, without tolls, over a favourably constructed railroad, to Boston, whose large and grown capital has already, by its facilities, attracted a large portion of the trade, over the Western railroad."

COMPARATIVE View of the Value of Real and Personal Property in Boston and
New York.

YEARS.	B O S T O N .			N E W Y O R K .		
	Real Estate.	Personal Estate.	TOTAL.	Real Estate.	Personal Estate.	TOTAL.
	dollars.	dollars.	dollars.	dollars.	dollars.	dollars.
1841.....	62,063,000	36,043,600	98,106,600	186,350,948	64,343,972	251,194,920
1842.....	65,599,500	41,223,800	106,733,300	176,489,042	61,294,559	237,783,601
1844.....	72,048,000	46,402,300	118,450,300	171,936,591	64,023,456	235,960,047
Increase	9,985,000	10,359,700	20,343,700			
Decrease	----	----	----	14,414,357	820,516	15,234,873

"This is a remarkable change in the face of affairs. Boston, since the completion of its railroad, has advanced more than New York has diminished. In 1825, the Erie canal was finished, and its effects in New York were as follows:—

REAL and Personal Estate, New York City.

Y E A R S .	Population.	Value.	Y E A R S .	Population.	Value.
	number.	dollars.		number.	dollars.
1816.....	95,519	52,074,200	1835.....	270,089	218,723,703
1825.....	166,086	101,160,046	1844.....	350,000	235,960,047

"In the ten years prior to the construction of the canal, the valuation increased twenty-five per cent—in the ten years succeeding its completion, it increased 117 per cent; in the last ten years, it has increased but eight per cent. This is a very marked result. Boston has increased, in the last four years, twenty per cent; at which rate her increase, for the ten years succeeding the completion of her railroads, is as great as that of New York in the decade commenced by the completion of the Erie canal. These are the marvellous results of rival public works upon the currents of trade and the value of property, at the great centres of business. The political divisions of a country have very little to do with its real interest, when it is divided into artificial or real routes for commerce. New York has expended large sums for the construction of canals: and has, in consequence, imposed a tax upon the northern counties of New York, which are in nowise benefitted by them; but will now, by the expenditure of New England capital, have all their material interests connected with Boston."—*Official Reports and Tables, Hunt's Merchants' Magazine.*

WELLAND CANAL TOLLS.—LEGAL RATES.

The first column of figures represents the amount to be paid for passing through the whole line; the second for passing between St. Catharine's and Port Dalhousie. In calculating the amount to be charged for passing between Port Maitland (the entrance from Lake Erie), and St. Catharine's, the collector deducts the amount of the last column from the first, except in the case of vessels which are charged as for the whole line. There is a reduction from the old rates of toll on nearly every article, amounting to seventy-five per cent in one or two instances; and on the principal articles of traffic, the reduction is twenty and twenty-five per cent.

PORT CHARGES, &c.

The following are additional particulars, not contained under the trade of each port, which see—

PHILADELPHIA Charges for American Vessels, or for those of States having Reciprocity Treaties.

ENTRY OF VESSELS, &c.	Port-charges.		ENTRY OF VESSELS, &c.	Port-charges.	
	dls.	cts.		dls.	cts.
Entry of a vessel of 100 tons and upwards....	2	50	Crew-list and bond.....	0	65
Ditto of a vessel under 100 tons.....	1	50	Passport and bond.....	0	40
Register and bond.....	2	25	Bill of health.....	0	20
Indorsement.....	1	00	Indorsement.....	1	00
Clearance of a vessel of 100 tons or upwards....	2	50	Sea-letter.....	0	80
Ditto of a vessel under 100 tons.....	1	50			

Vouchers are given in all cases.

NEW ORLEANS.—Customs' fees for entrance and clearance of vessels are from five to ten dollars.

Harbour-master's fees, three cents per ton, American measurement.

Port-wardens' fees, five dollars for each vessel.—Vouchers always given.

NEW YORK.

Light Money.—Not charged to any vessels.

Entry Fee.—Every vessel, under any flag, pays this charge, being three dollars, if under 100 tons; and five dollars fifty cents, if of 100 tons or over.

Measurement.—Every foreign vessel upon entering a port in the United States for the first time pays this charge, which is, if under 100 tons, one dollar; over 100 tons, but less than 200 tons, one dollar fifty cents; if 200 tons or over, two dollars.

Telegraph.—Paid only by vessels which use it by contract, having private signals.

Permits.—These, being for passengers' luggage, are charged to the vessel, twenty cents for every five passengers.

United States' Hospital Money.—This is a charge made exclusively to American vessels, being twenty cents per month for master, officers, and crew, each, for the time absent from the United States.

The above are the fees paid upon the entering of a vessel, and for which a voucher is given by the cashier of the customs.

Upon clearing for a foreign port, the only charge to a foreign vessel is, if under 100 tons, one dollar fifty cents; if 100 tons or over two dollars fifty cents. The same charge to American vessels, with these additional: crew-list, sixty-five cents; articles certified, twenty cents; bill of health, when required, twenty cents; and certified manifest, when required, twenty cents. No voucher is given for these charges.—See all other particulars under the head of *New York*.

BALTIMORE PORT CHARGES.	Currency.		Sterling.

List of seamen, ditto.....	0	65	2	8

Vessels arriving from sea between the 30th of April and the 1st of November are required to come to, at the Lazaretto Point, and there remain until visited by the health officer.

HEALTH OFFICER'S FEE.	Currency.		Sterling.	
	dlrs.	cts.	£	s. d.
Ship or barque.....	6	00	1	4 9
Brig or brigantine.....	4	00	0	16 6
Schooner or sloop.....	2	00	0	8 3

United States vessels are also charged with hospital money, from which, of course, British vessels are exempt.

CHARLESTON CUSTOMS, FEES, &c.	Currency.		Sterling.	
	dlrs.	cts.	£	s. d.
Entrance of a vessel, under 100 tons.....	1	70	0	7 7
" " " over 100 tons.....	2	70	0	12 1
Clearance of a vessel, under 100 tons.....	1	70	0	7 7
" " " over 100 tons.....	2	70	0	12 1
*Surveyor's fees, on a vessel under 100 tons....	1	50	0	6 9
* " " " over 100 tons.....	2	00	0	9 0

* The surveyor's fees are only charged on the first visit of a vessel to that port.

Harbour-master's fee, one cent and a half per ton.

The officers of customs give no vouchers for their fees ; the harbour-master does.

There are no charges levied on British vessels in the port of Charleston which are not levied on vessels under the American flag ; nor are there any commercial, fiscal, or other advantages enjoyed by American vessels at this port from which British vessels are excluded.

NORFOLK, VIRGINIA.—There are neither tolls nor dues of any kind imposed by public authority on British shipping in the ports of this district, and the only fees to which they are subject are, two dollars for a square-rigged, or one dollar twenty-five cents for lesser vessels, to the harbour-master, for mooring, securing, or removing the vessel ; and the fees of the custom-house, upon entry or clearance, depending, however, principally upon the number and nature of the documents that may be required, the charge for each being regulated by Act of Congress, and precisely the same throughout the United States, viz. :—

CUSTOMS, FEES, &c.	Currency.	CUSTOMS, FEES, &c.	Currency.
	dlrs. cts.		dlrs. cts.
Entry of a vessel of 100 tons or upwards.....	2 50	Clearance of a vessel under 100 tons.	1 50
" " " under 100 tons....	1 50	Every official bond taken.....	0 40
Clearance of a vessel of 100 tons or upwards.....	2 50	Debenture or other certificate.....	0 20
		Permit to land goods.....	0 20
		Bill of health.....	0 20

The only vouchers given are the documents that may be required, or, if specially desired, a memorandum of the several charges incurred will be furnished ; but such is not usually called for.

There are no charges levied on British vessels to which those under the flag of the country are not liable ; nor are there any sort of commercial, fiscal, or other advantages enjoyed by the one and not by the other, being placed upon terms of perfect reciprocity by the commercial treaty between the two countries.

RATES of Pilotage for Tybee Bar and River Savannah; as revised by a Law of the State of Georgia, passed December, 1836, adding Twenty per cent to the former Rates.

RETURN of the British Trade at the Port of New York during the Year ending the 31st of December, 1844.

Of the 325 British vessels arrived, there were from Great Britain, with coals and salt 1, value of cargo 4100 dollars; marble 1, value of cargo 1724 dollars; coals and iron, 1, value of cargo 6380 dollars; iron 15, value of cargo 318,921 dollars; dry goods 3, value of cargo 95,000 dollars; soda 1, value of cargo 3500 dollars; coals 9, value of cargo 62,850 dollars; chalk 2, value of cargo 9000 dollars; bagging 1, value of cargo 48,000 dollars; general cargo 15, value of cargo 855,914 dollars; salt 15, value of cargo 116,303 dollars; oil, &c. 2, value of cargo 50,000 dollars; slate 1, value of cargo 2766 dollars; sugar 1, value of cargo 21,774 dollars; in ballast 13.

From Nova Scotia, viz.: Yarmouth, with wood 5, value of cargo 300 dollars; in ballast 1. Sydney, with coals 11, value of cargo 5699 dollars. Cumberland, with potatoes 1, value of cargo 600 dollars; grindstones 6, value of cargo 6840 dollars. Kempt, plaister 1, value of cargo 300 dollars. Parsboro', plaister 3, value of cargo 450 dollars. Walton, plaister 1, value of cargo 90 dollars. Halifax, fish 4, value of cargo 18,250 dollars; potatoes 2, value of cargo 926 dollars; coals 1, value of cargo 100 dollars; skins 1, value of cargo 4162 dollars; in ballast 1. Cornwallis, with potatoes 5, value of cargo 5730 dollars. Douglas, with plaister 2, value of cargo 210 dollars. Shelburne, granite 1, value of cargo 338 dollars. Truro, with plaister 1, value of cargo 300 dollars. Guysboro', with plaister 1, value of cargo 500 dollars. Pictou, with coals 4, value of cargo 1698 dollars; with plaister 1, value of cargo 140 dollars; with grindstones 2, value of cargo 1800 dollars. Windsor, plaister 62, value of cargo 7715 dollars; potatoes 1, value of cargo 568 dollars; in ballast 1. Digby, with fish 1, value of cargo 1200 dollars; potatoes 1, value of cargo 400 dollars. Maitland, with plaister 1, value of cargo 80 dollars.

From Sidney (Cape Breton), with coals 2, value of cargo 901 dollars. New Brunswick, with plaister 2, value of cargo 480 dollars; with potatoes 3, value of cargo 3100 dollars. Nassau, New Providence, with fruit 1, value of cargo 2000 dollars; with wood 1, value of cargo 500 dollars. Connecticut, with iron 1, value of cargo 420 dollars; plaister 1, value of cargo 100 dollars; in ballast 5. Rhode Island, in ballast 1. Boston, in ballast 1. Pernambuco, in ballast 2. Bahia, in ballast 2. Harbour (Brit.), in ballast 1. Honduras, with mahogany 4, value of cargo 11,340 dollars. Demerara, 1, value of cargo 240 dollars; in ballast 1. Newfoundland, with fish 1, value of cargo 680 dollars; salt 1, value of cargo 140 dollars; junk 1, value of cargo 750 dollars; skins 3, value of cargo 8338 dollars; in ballast 8. Bahamas, with salt 26, value of cargo 20,565 dollars; fruit 2, value of cargo 3850 dollars; turtle 3, value of cargo 3850 dollars; pine-apples 1, value of cargo 1500 dollars; dyewood 1, value of cargo 500 dollars; in ballast 1. Bermuda, with arrowroot 1, value of cargo 1000 dollars; salt 1, value of cargo 200 dollars; hides 2, value of cargo 2000 dollars; in ballast 9. St. Vincent, with arrowroot 1, value of cargo 200 dollars; copper 1, value of cargo 1000 dollars; in ballast 3. Nevis, in ballast 1. Antigua, with oil, &c. 1, value of cargo 4000 dollars. St. Kitt's, in ballast 1. Jamaica, with logwood 5, value of cargo 12,000 dollars; pimento 4, value of cargo 39,200 dollars; in ballast 2. Barbadoes, in ballast 4. Trinidad, with hides 1, value of cargo 2500 dollars; in ballast 1. Prince Edward Island, with potatoes 3, value of cargo 2914 dollars. Sierra Leone, with oil 1, value of cargo 887 dollars; hides 2, value of cargo 7000 dollars; cane-wood 1, value of cargo 2785 dollars.

Total number of vessels 325.

Total value of cargoes 1,789,578 dollars.

Of the 333 British vessels departed, there were for Great Britain, with naval stores 2, value of cargo 70,000 dollars; cotton 14,* value of cargo 404,918 dollars; cotton seed 1, value of cargo 70,860 dollars; annotta 2, value of cargo 104,933 dollars; logwood 2, value of cargo 7810 dollars; provisions 3, value of cargo 60,280 dollars; ashes 2, value of cargo 47,020; turpentine 4, value of cargo 40,585 dollars;

* One of these vessels has no value given.

copper ore 1, value of cargo 18,911 dollars; tar 1, value of cargo 17,800 dollars; cedar 1, value of cargo 9400 dollars; flour 1, value of cargo 2300 dollars; general cargo 5, value of cargo 163,500 dollars; provisions one, value of cargo 18,000 dollars; beef 1, value of cargo 17,900 dollars; wheat 1, value of cargo 7000 dollars; hides 1, value of cargo 40,000 dollars

For Nova Scotia, viz., Truro, with flour 1, value of cargo 5716 dollars. Liverpool, with provisions 1, value of cargo 1900 dollars. Dalhousie, in ballast 2. Cumberland, with provisions 2, value of cargo 500 dollars; flour 1, value of cargo 1000 dollars. Yarmouth, with flour 2, value of cargo 4150 dollars; provisions 5, value of cargo 13,350 dollars. Halifax, with flour 3, value of cargo 10,215 dollars; provisions 12, value of cargo 62,598 dollars; flour and tobacco 1, value of cargo 9000 dollars; tobacco 3, value of cargo 17,300 dollars; hemp 1, value of cargo 2500 dollars; flour and rum 1, value of cargo 2000 dollars; in ballast 2. Windsor, flour 6, value of cargo 767 dollars; provisions 12,* value of cargo 1944 dollars; flour and rye 1, value of cargo 95 dollars; corn 1, value of cargo 32 dollars; in ballast 17. Sackville, in ballast 1. Parsboro', with provisions 1, value of cargo 50 dollars; in ballast 2. Digby, with flour 1, value of cargo 400 dollars. Herton, in ballast 1. Pictou, with tobacco 1, value of cargo 1600 dollars; fruit 1, value of cargo 30 dollars; in ballast 4. Sydney, in ballast 1. Guysboro', with provisions 1, value of cargo 10,240 dollars.

For Newfoundland, with provisions 1, value of cargo 4314 dollars. With flour 6, value of cargo 32,007 dollars; provisions 54, value of cargo 364,649 dollars; flour and pork 1, value of cargo 7000 dollars; tea, &c. 1, value of cargo 1572 dollars; butter 1, value of cargo 4500 dollars; pork 1, value of cargo 6000 dollars; molasses 2, value of cargo 12,100 dollars; general 1, value of cargo 7000 dollars; rum, tea, &c. 1, value of cargo 3200 dollars; in ballast 1. Placentia, Newfoundland, with pork 1, value of cargo 3566 dollars. St. Peter's with glassware 1, value of cargo 18,043 dollars. Fogo, Newfoundland, with flour, 1, value of cargo 9900 dollars. New Brunswick, in transit 1. St. John's, New Brunswick, with flour 4, value of cargo 15,853 dollars; provisions 13, value of cargo 54,492 dollars; tobacco 4, value of cargo 24,000 dollars; clover-seed 1, value of cargo 4500 dollars; general 1, value of cargo 150 dollars; flour and hemp 1, value of cargo 3000 dollars; staves 1, value of cargo 2000 dollars; in ballast 9; in transit 2. St. Andrew's, with wheat 1, value of cargo 3000 dollars; in ballast 1. Miramichi, New Brunswick, provisions 4, value of cargo 25,095 dollars. Calais, New Brunswick, in ballast 2. For Canada, in ballast 2. Quebec, general 1, value of cargo 16,450 dollars; naval stores 1, value of cargo 4400 dollars; in ballast 18; with resin 1, value of cargo 7540 dollars; provisions 2, value of cargo 27,000 dollars. Montreal, with lead 1, value of cargo 9270 dollars; tar 1, value of cargo 10,500 dollars. Africa, in ballast 3. Sierra Leone, assorted cargo 1, value of cargo 8941 dollars; tobacco 1, value of cargo 2855 dollars. Gambia, with tobacco 1, value of cargo 11,000 dollars. Pernambuco, with provisions 1, value of cargo 5450 dollars. Demerara, with provisions 3, value of cargo 21,430 dollars. Honduras, with provisions, 3, value of cargo 29,000 dollars. Green Turtle Key, with provisions 1, value of cargo 900 dollars; lumber 1, value of cargo 2200 dollars. Eleuthera, with flour 1, value of cargo 350 dollars. Harbour Island, with flour and hemp 1, value of cargo 4900 dollars. Albaco, with provisions 1, value of cargo 1700 dollars. Bermuda, with provisions 7, value of cargo 45,058 dollars; flour 3, value of cargo 44,100 dollars. Antigua, with provisions 1, value of cargo 4331 dollars. St. Vincent, with provisions 3, value of cargo 19,798 dollars. St. Kitt's, with flour and meal 1, value of cargo 8000 dollars. Jamaica, with provisions 3, value of cargo 15,130 dollars; assorted cargo 1, value of cargo 6367 dollars. Montego Bay, with provisions 2, value of cargo 8570 dollars. Barbadoes, with provisions 2, value of cargo 11,396 dollars; flour 1, value of cargo 7300 dollars. Norfolk, in ballast 1. Menadie, with wheat 1, value of cargo 350 dollars. Eastport, in ballast 1. St. Stephen's, South Carolina, in ballast 1. Sisal, Mexico, in ballast 1. Wilmington, in ballast 1. Nassau, New Providence, with provisions 2,

* One of these vessels has no value given.

value of cargo 4240 dollars ; with flour 2, value of cargo 4800 dollars. Harbour Grace, with apples 1, value of cargo 2500 dollars ; provisions 3, value of cargo 24,158 dollars.

Total number of vessels 333.

Total value of cargoes 2,189,529 dollars.

PORT OF CHARLESTON.—Of the 92 British vessels which arrived during the year 1844, there were from Great Britain, with coals and iron 1, value of cargo 820*l.* 5*s.*; iron 4, value of cargo 9265*l.*; salt and potatoes 3, value of cargo 920*l.* 10*s.*; salt and coals 4, value of cargo 1100*l.*; salt, hardware, and earthenware 7, value of cargo 13,379*l.*; coals 2, value of cargo 285*l.* 10*s.*; salt, coals, dry goods, and hardware 2, value of cargo 12,280*l.*; salt 12, value of cargo 2640*l.* 6*s.* 6*d.*; with glass, spirit, and ale 1, value of cargo 396*l.*; salt, potatoes, and ale 1, value of cargo 130*l.*; coals, linen, salt, and potatoes 1, value of cargo 380*l.*; coals and potatoes 2, value of cargo 152*l.* 10*s.*; hay, potatoes, and salt 2, value of cargo 318*l.*; dry goods 1, value of cargo 5330*l.*; in ballast 16.

From Nassau, with turtle 1, value of cargo 20*l.*; in ballast 8. Savannah, with cotton 1 (in distress). Demerara, in ballast 2. Rio de Janeiro, in ballast 1. Barbadoes, in ballast 2. Jamaica, in ballast 5. St. Thomas, in ballast 1. Bermuda, in ballast 4. Harbour Island, with salt and fruit 1, value of cargo 40*l.* Oran, in ballast 1. Gibraltar, in ballast 4. PORT OF WILMINGTON.—Of the 30 British vessels which arrived in 1844, there were, from Great Britain, with ballast and specie 1, value of cargo 583*l.* 6*s.* 8*d.*; Barbadoes, with salt and specie 1, value of cargo 312*l.* 15*s.*; Demerara, with ballast and specie 3, value of cargo 895*l.* 16*s.* 8*d.*; Nevis, with ballast and specie 2, value of cargo 270*l.* 16*s.* 8*d.*; Antigua, with ballast and specie 6, value of cargo 1186*l.* 12*s.*; Trinidad, with ballast and specie 3, value of cargo 625*l.*; Jamaica, ballast and specie 2, value of cargo 979*l.* 3*s.* 4*d.*;

* One vessel arrived in distress, and departed with cotton. No value given.

Nassau, ballast and specie 4, value of cargo 750*l.*; Halifax, with potatoes 1, value of cargo 62*l.* 10*s.*; New York, in ballast 1; Turk's Island, with salt 1, value of cargo 86*l.* 6*s.* 8*d.*; salt and specie 1, value of cargo 250*l.*; St. Kitt's, in ballast and with specie 3, value of cargo 750*l.*; St. Vincent, in ballast and specie 1, value of cargo 208*l.* 6*s.* 8*d.* Total number of vessels, 30. Total value of cargoes, 6960*l.* 13*s.* 8*d.*

Of the 30 British vessels departed, there were for Great Britain, with turpentine and tar 2, value of cargo 1895*l.* 16*s.* 8*d.*; with lumber and tar 1, value of cargo 162*l.* 1*s.* 4*d.* Grenada, with lumber, rice, and tobacco 1, value of cargo 500*l.* Barbadoes, lumber, rice, and staves 1, value of cargo 250*l.*; lumber and shingles 1, value of cargo 76*l.* 0*s.* 10*d.* Antigua, lumber and staves 5, value of cargo 1153*l.* 2*s.* 6*d.*; lumber and shingles 1, value of cargo 250*l.* Montserrat, resin, tar, and rice 1, value of cargo 145*l.* 16*s.* 8*d.* Nevis, lumber and staves 2, value of cargo 343*l.* 15*s.*; staves and shingles 1, value of cargo 104*l.* 3*s.* 4*d.* Trinidad, lumber and corn 1, value of cargo 166*l.* 13*s.* 4*d.*; lumber and staves 1, value of cargo 142*l.* 10*s.*; lumber and rice 1, value of cargo 375*l.* Nassau, lumber and shingles 4, value of cargo 658*l.* 6*s.* 8*d.* Halifax, rice and tar 1, value of cargo 264*l.* 11*s.* 8*d.*; rice and naval stores 1, value of cargo 625*l.* Jamaica, lumber and shingles 1, value of cargo 187*l.* 10*s.*; lumber and rice 1, value of cargo 250*l.* St. Kitt's, lumber and staves 3, value of cargo 771*l.* 1*s.* 8*d.* Total number of vessels, 30. Total value of cargoes, 8361*l.* 9*s.* 8*d.*

Commerce and Navigation of Baltimore, 1844.—The following is a list of the foreign and coastwise arrivals at the port of Baltimore, during the year 1844, made up from the monthly tables published in the *Baltimore American*:—

Total Foreign—ships, 60; barques, 48; brigs, 198; schooners, 127. Total coastwise—ships, 17; barques, 55; brigs, 182; schooners, 929.

The whole number of arrivals, during the year 1844, was 1620. Of this number there were, American, 1508; British, 65; Bremen, 34; Hanoverian, four; Swedish, two; Spanish, two; Oldenburg, one; Sardinian, one; Holland, one; Hamburg, one; and Danish, one.

Commercial Navigation of Boston, in 1844.—The following tables embrace the arrivals and clearances at the port of Boston, during the year 1844, commencing on the 1st of January, and ending on the 30th of December:—

Arrivals.—Foreign—ships, 156; barques, 214; brigs, 598; schooners, 1237. Coastwise—ships, 121; barques, 191; brigs, 785; schooners, 4008; sloops, 152. Total number of arrivals for the year 1844, ships, 277; barques, 405; brigs, 1383; schooners, 5245; sloops, 152.

Of the above, there were, British, 15 barques, 131 brigs, and 1009 schooners; Sicilian, two barques and five brigs; Swedish, one barque and four brigs; Bremen, two ships and one brig; Prussian, one barque and two brigs; German, one brig; Hamburgian, four brigs; Dutch, one brig; Norwegian, one barque; Sardinian, one brig; Austrian, one barque; and the remainder, American.

Clearances.—Foreign—ships, 93; barques, 202; brigs, 515; schooners, 1166. Coastwise—ships, 205; barques, 211; brigs, 627; schooners, 1627; sloops, 104. Total number of clearances for the year 1844, ships, 298; barques, 413; brigs, 1142; schooners, 2973; sloops, 104.

Of the above, there were British, 15 barques, 130 brigs, and 1025 schooners; Sicilian, three barques and five brigs; Swedish, one barque and three brigs; Bremen, two ships and one brig; Prussian, one barque and two brigs; German, one brig; Hamburgian, four brigs; Dutch, one brig; Norwegian, one barque; Sardinian, one brig; and the remainder American.

A large number of wood coasters have also arrived, which are not included in the above estimate. The disparity between the arrivals and clearances is owing to the fact that a great number of the vessels which are reported as arrived, do not clear at the custom-house before sailing, being under licence.

During the year, the royal mail steamship *Britannia*, running between this port and Liverpool, has entered and cleared at the custom-house four times. The *Hibernia* has entered five, and cleared six times. The *Caledonia* has entered and cleared five times. The *Acadia* has entered five, and cleared four times.

EXPORTS of Cotton and Tobacco from New Orleans, for the Year commencing the 1st of September, 1844, and ending the 31st of August, 1845.

Sugar.—In Louisiana alone in the United States is it produced in any quantity from the cane, and the quantity so produced is never sufficient for consumption of the United States, and in foreign markets it is only of importance as it supplies or fails to supply our home demand. The following table will show how varied and uncertain is the yield. An unfavourable time for planting or an early frost will reduce the probable yield one-half, and we are never actually sure of our crop until it be actually rolled.

NEW ORLEANS COTTON PRESS CHARGES.

Charges to Factors and Receivers.—Drayage, storage, and labour, piling up, and turning out for weighing, twenty-seven cents and a half per bale for the first sixty days, and ten cents per bale per month afterwards. All extra labour will be charged.

Charges to Shippers of Compressed Cotton.—Labour, in all cases, five cents per bale. If not ordered within fifteen days from the time it is received, ten cents per bale per month storage will be charged additional. All necessary repairs will be charged. Drayage on ship-board, within the first and second municipalities, twelve cents and a half per bale; within the limits of the third municipality, fifteen cents per bale.

Charges on Uncompressed Cotton.—All cotton remaining over night only, or longer, will be charged ten cents per bale per month, and all labour incurred.

All cotton changing ownership, or transferred from one party to another, will be charged new storage, and any labour which may be incurred.

All cotton hauled to the presses for compressing, will be charged the drayage to the press, in addition to that on ship-board.

All the foregoing charges will be considered payable in cash, and collected at least once per month.

It will be seen, that we have deducted from the New Orleans and Mobile statements, the quantity received at those ports from Texas—Texas being a foreign country. Our next annual statement will probably include Texas in the crop of the United States.

Our estimate of the quantity taken for consumption, does not include any cotton manufactured in the states south and west of Virginia, nor any in that state, except in the vicinity of Petersburg and Richmond.

The quantity of new cotton received at the shipping ports amounted to about 7500 bales, same as last year.

In regard to the crop now gathering, we have loud complaints of injury from drought in certain sections, while in others the yield is represented as good. It is too early yet to form any reliable conclusion as to the quantity that may reach the market.

In the New Orleans statement, we notice an allowance of 6000 bales for cotton sent up the river to the western states. As it is probable some of this cotton reaches Philadelphia and Baltimore "overland," we omit the overland item in our statement of the crop for this year.

ICE TRADE OF THE UNITED STATES.

The principal locality for cutting ice to be exported to foreign countries, is the Wenham Lake, near Boston. Boston and the suburb, or town of Charlestown, near the lake, are the principal places of export.

There are in Boston sixteen companies engaged in transporting ice to the East and West Indies, New Orleans, South America, and Europe, and to other warm climates. In 1830, the quantity of ice shipped from Charlestown to distant ports amounted to 30,000 tons. No less than 50,000 tons were exported from Boston. The expense to the shippers was 12,340 dollars, or about a quarter of a dollar a ton. The average receipts were 3,570,000 dollars; a single firm in Boston freighted 101 vessels, and a cargo was sent to the East Indies and exchanged pound for pound for cotton, which was sold at a profit in England. Sawdust, for packing, is worth three dollars per cord. Formerly, ice sold in New Orleans for six cents (*threepence*) per lb., and now sells for one cent (*one halfpenny*) per lb.; but more money is made from the increased consumption at one cent than was made at six cents. The ice is sawed into blocks by a machine, and is packed on board the vessel with straw and hay, in thin deal boxes, air-tight. One company expended 7000 dollars for hay alone. The annual crop of Wenham Lake ice is considered good at 200,000 tons, and can be cut and housed in about three weeks.

In September, 1833, the first cargo of ice from Boston was discharged at Calcutta.

Since 1833, the trade has increased greatly; and, from the small beginning at Boston, has extended from other northern ports; and a considerable quantity is now annually shipped at New York. Great improvements have been made in packing, so that the wastage is much reduced. Large quantities are shipped to New Orleans, and other southern ports; and the home consumption of ice has augmented largely. Salmon, from the state of Maine, and cod and other fish, from Boston, are packed in ice, and sent by the various railroads to the interior of western New England, and as far north as Buffalo.

The export of ice from Boston, for the month ending August 31, 1844, is as follows:—

The Wenham Lake is in an elevated position, and embosomed within hills. The lake has no inlet whatever; but is fed solely by springs which issue from

the rocks at its bottom, a depth of 200 feet from its surface. This depth explains the great solidity of the ice formed upon the lake.

The ice-houses are built of wood, with double walls; the space between which is filled with sawdust; thus interposing a medium, that is nearly a non-conductor of heat, between the ice and the external air; the consequence of which is, that the ice is not affected by the temperature of the external atmosphere.

The machinery employed for cutting the ice, was invented for that purpose. It is worked by men and horses.

"From the time when the ice first forms, it is carefully kept free from snow until it is thick enough to be cut; that process commences when the ice is a foot thick. A surface of some two acres is then selected, which at that thickness will furnish about 2000 tons; and a straight line is then drawn through its centre from side to side each way. A small hand-plough is pushed along one of these lines, until the groove is about three inches deep and a quarter of an inch in width, when the 'marker' is introduced. This implement is drawn by two horses, and makes two new grooves parallel with the first, twenty-one inches apart, the gauge remaining in the original groove. The marker is then shifted to the outside groove, and makes two more. Having drawn these lines over the whole surface in one direction, the same process is repeated in a transverse direction, marking all the ice out into squares of twenty-one inches. In the meantime, the 'plough' drawn by a single horse, is following in these grooves, cutting the ice to a depth of six inches.

"One entire range of blocks is then sawn out, and the remainder are split off toward the opening thus made, with an iron bar. This bar is shaped like a spade, and of a wedge-like form. When it is dropped into the groove, the block splits off; a very slight blow being sufficient to produce that effect, especially in very cold weather. The labour of 'splitting' is light or otherwise, according to the temperature of the atmosphere. 'Platforms,' or low tables of frame-work, are placed near the opening made in the ice, with iron slides extending into the water, and a man stands on each side of this slide, armed with an ice-hook. With this hook the ice is caught, and, by a sudden jerk, thrown up the 'slide' on to the 'platform.' In a cold day every thing is speedily covered with ice by the freezing of the water on the platforms, slides, &c., and the enormous blocks of ice, weighing, some of them, more than two cwt., are hurled along these slippery surfaces, as if they were without weight.

"Forty men and twelve horses will cut and stow away 400 tons a day; in favourable weather, 100 men are sometimes employed at once. When a thaw or a fall of rain occurs, it entirely unfits the ice for market, by rendering it opaque and porous, and occasionally snow is immediately followed by rain, and that again by frost, forming snow-ice, which is valueless, and must be removed by the 'plane.' The operation of planing is similar to that of cutting.

"In addition to filling their ice-houses at the lake and in the large towns, the company fill a large number of private ice-houses during the winter—all the ice for these purposes being transported by railway. It will easily be believed, that the expense of providing tools, building houses, furnishing labour, and constructing and keeping up the railway, is very great; but the traffic is so extensive, and the management of the trade so good, that the ice can be furnished, even in England, at a very trifling cost.

"Extensive ice-houses, in London and at Liverpool, have been constructed of stone, &c. Though transported in the heat of summer, it is not much reduced in bulk. The masses of ice are so large, that a small surface only is exposed to atmospheric action in proportion to their weight, and therefore do not suffer from their exposure to it, as the smaller and thinner fragments do, which are obtained in our own or other warmer climates. It appears, also, that ice frozen upon very deep water, is more hard and solid than ice of the same thickness obtained from shallow water."

THE Export of Ice from Boston for the Month of February, 1845, has been as follows:

PLACES.	Tons.	PLACES.	Tons.

Production of Hemp in Missouri.—A report made to the Missouri legislature, on the subject of hemp growing in that state, contains the following statistics :—"The chamber of commerce in St. Louis, in 1842, stated the crop of 1840, which was brought into market in 1841, at 1460 tons. A memorial of the citizens of St. Louis, to the Congress of the United States, made in 1841, states the hemp crop of 1841 at near 10,000 tons, and the crop of 1842 at near 17,000 tons. The crop of 1843, owing to the unfavourable weather, did not exceed that of 1842. These estimates are borne by other facts. The St. Louis *Price Current*, in summing up the imports and exports of the city for the year 1844, states that 6275 bales of hemp were exported from the city of St. Louis, during the year 1844. In addition to this, there were exported 5007 pieces of bagging, and 15,490 coils of rope. It is believed, says the *Louisville Journal*, that the exports registered are considerably below the actual amount."

In *Hunt's Magazine* it is stated—

"*The Egg Trade in Cincinnati.*—Every day develops some new illustration of the enterprise of our people. The ice trade of the east has grown up, in a few years, to importance; employing a considerable amount of tonnage. In the west, the egg trade bids fair to rival it. The business in that fragile commodity, as we gather from the *Cincinnati Gazette*, is quite an item in the sum of her productive industry. One firm alone, in Cincinnati (Townsend and Co.), during the first six months of 1845, shipped to New York 234 barrels of eggs; to Baltimore, seventy barrels; and to New Orleans, 3976 barrels! Each barrel contains ninety dozen, which makes the aggregate shipment 4,624,400 eggs! During the year ending as above, the egg trade of this firm amounted to 36,144 dollars 60 cents. There are five other houses in Cincinnati engaged in the business. The foreign egg trade of Cincinnati, the past year, has amounted to 10,700 barrels, which is 963,000 dozen, or 11,556,000 eggs! The aggregate value of this trade, for the year, according to the data here given, is 90,361 dollars 50 cents. The business is a very hazardous one, owing to the great fluctuations in the New Orleans market. In the course of the past year, for example, western eggs have sold there as high as twenty-two dollars per barrel, and as low as three dollars. In addition to this export trade, these establishments do also a heavy home trade. That of Townsend and Co. supplies regularly five steamboats, with thirty-six barrels a trip; which, at twelve trips a year, is 432 barrels. It also furnishes constantly the consumption of several of the largest hotels, which use at least 260 barrels per year, and does a retail business, amounting to not less than thirty-three barrels per year. These several amounts make 725 barrels to add to the 4280 barrels shipped; which gives an aggregate of 5005 barrels, or 450,450 dozen, as the annual trade of this one house. Besides this, the annual city consumption is estimated at 1,213,333 dozen. A further recapitulation shows the following result as to value :—

	dollars	cts.
Value of 10,700 barrels of eggs shipped from this port, at eight dollars forty-four cents and a half per barrel.....	90,361	50
Value of 1,213,333 dozen eggs consumed in this city, at eight cents per dozen...	97,066	64
Total annual value of the egg trade of Cincinnati.....	187,428	14

PROGRESS OF THE NEW ENGLAND WHALE FISHERY.

The annual statement of this important branch of commerce, including the imports and exports of oil and whalebone, average prices, progress of the fishery, &c., as published in the *Whaleman's Shipping List*, contains matter of much interest to those engaged in the whale fishery. The imports of sperm oil and whalebone into the United States, from January 1, 1844, to January 1, 1845, in 199 ships and barques, twenty-three brigs, and sixteen schooners and sloops, were 139,594 barrels of sperm, 262,047 barrels of whale oil, and 2,532,445 pounds of bone.—See *Whale Fishery of the United States*.

IMPORTS of Sperm and Whale Oil, from 1838 to 1844, inclusive.

Y E A R S.	Sperm.	Whale.	Y E A R S.	Sperm.	Whale.
	barrels.	barrels.		barrels.	barrels.
1838.....	132,356	226,532	1842.....	166,637	164,641
1839.....	142,336	229,783	1843.....	161,985	206,727
1840.....	157,791	207,908	1844.....	130,524	262,047
1841.....	159,304	207,348			

The average price of oil, during the year 1844, has been ninety cents and a half to ninety cents and three-quarters per gallon for sperm, and thirty-six cents and a half to thirty-six cents and two-thirds per gallon for whale oil. Average price of bone, forty cents. January 1, 1845, prices:—Sperm, eighty-eight cents; whale, thirty-one cents to thirty-four cents; whalebone, thirty-eight cents to forty cents. The quantity of crude sperm oil in the country, out of the hands of manufacturers, on the 1st of January, 1845, is estimated at 32,992 barrels; and the amount of crude whale oil at 32,950 barrels. The number of vessels employed in the whale fishery, on the 1st of January, 1845, was 643 ships and barques, thirty-five brigs, seventeen schooners and sloops—in all, 218,655 tons. In January 1, 1844, the number engaged in the New England whale fishery, were 595 ships and barques, forty-one brigs, nine schooners and sloops—tonnage, 200,147 tons.

Mr. Grinnell, of New Bedford, Massachusetts, a member of Congress, stated in a speech,—

“I have prepared, with great care, a table from authentic sources, to show the consumption of domestic and foreign articles by our whaling fleet, now consisting of 645 ships, barques, brigs, and schooners, tonnage 200,000 tons; cost, at the time of sailing, 20,000,000 dollars; manned by 17,500 officers and seamen, one-half of whom are green hands when the vessels sail. By this table it will be seen, that the annual consumption by this fleet is 3,845,500 dollars; only 400,000 dollars is of foreign articles. The value of the annual import of oil and whalebone in a crude state is 7,000,000 dollars; when manufactured, it probably is increased in value to 8,000,000 dollars, or 9,000,000 dollars. The whole amount of exports of oil, whalebone, and sperm candles, is only 2,000,000 dollars, leaving 6,000,000 dollars, or 7,000,000 dollars, to be consumed in this country.

“This fleet of whaling ships is larger than ever pursued the business before. Commercial history furnishes no account of any parallel; our ships now outnumber those of all other nations combined, and the proceeds of its enterprise are in proportion and diffused to every part of our country. The voyages of those engaged in the sperm fishery average three years and a half; they search every sea, and often cruise three and four months with a man at each mast-head on the look-out, without the cheering sight of a whale.”

NEW SOUTH WALES AND VAN DIEMAN'S LAND WHALE FISHERY.

In 1836 and 1837, sixty-eight ships were employed in the whale fishery belonging to these colonies; in 1844, the number is said to be reduced to thirty ships.

The Bay of Islands, New Zealand, has long been the favourite resort of ships engaged in the sperm or deep sea fishery; and it is considered to be the most convenient port which they could touch at in the whole of the South Pacific.

The natives in that neighbourhood, who have revolted against the government, are expert whale fishers; and might, it is said, be advantageously employed. They are good seamen, and one of them is, or was, acting as a mate on board a whaling ship belonging to Mr. Enderby.

NEW POST-OFFICE LAW.

A law was passed by Congress, 3rd of March, 1845, which, though indigested, and far from sound in all its provisions, constitutes a great reform of the previous law. It diminishes the rate of postage about one-half, and stipulates,

That from and after the first day of July next, members of Congress and delegates from territories, may receive letters not exceeding two ounces in weight, free of postage, during the recess of Congress, any thing to the contrary in this act notwithstanding: and the same franking privilege which is granted by this act to the members of the two Houses of Congress, is hereby extended to the vice-president of the United States; and in lieu of the rates of postage now established by law, there shall be charged the following rates, viz.: For every single letter in manuscript, or paper of any kind by or upon which information shall be asked for or communicated in writing, or by marks and signs, conveyed in the mail for any distance under 300 miles, five cents; and for any distance over 300 miles, ten cents; and for a double letter there shall be charged double these rates; and for a treble letter treble these rates; and for a quadruple letter quadruple these rates; and every letter or parcel not exceeding half an ounce in weight shall be deemed a single letter, and every additional weight of half an ounce, or additional weight of less than half an ounce, shall be charged with an additional single postage. And all drop letters, or letters placed in any post-office, not for transmission by mail, but for delivery only, shall be charged with postage at the rate of two cents each. And all letters which shall hereafter be advertised as remaining over in any post-office, shall, when delivered out, be charged with the costs of advertising the same in addition to the regular postage, both to be accounted for as other postages now are.

2. That all newspapers of no greater size or superficies than 1900 square inches may be transmitted through the mail, by the editors or publishers thereof, to all subscribers or other persons within thirty miles of the city, town, or other place in which the paper is or may be printed, free of any charge for postage whatever; and all newspapers of and under the size aforesaid, which shall be conveyed in the mail any distance beyond thirty miles from the place at which the same may be printed, shall be subject to the rates of postage chargeable upon the same under the thirtieth section of the act of Congress, approved the 3rd of March, 1825, entitled "An Act to reduce into one the several Acts for establishing and regulating the Post-Office Department," and upon all newspapers of greater size or superficial extent than 1900 square inches, there shall be charged and collected the same rates of postage as are prescribed by this act to be charged on magazines and pamphlets.

3. That all printed or lithographed circulars and handbills or advertisements, printed or lithographed on quarto, post, or single-cap paper, or paper not larger than single-cap, folded, directed, and unsealed, shall be charged with postage at the rate of two cents for each sheet, and no more, whatever be the distance the same may be sent; and all pamphlets, magazines, periodicals, and every other kind and description of printed or other matter (except newspapers), which shall be unconnected with any manuscript communication whatever, and which is or may be lawful to transmit by the mail of the United States, shall be charged with postage at the rate of two cents and a half for each copy sent, of no greater weight than one ounce, and one cent additional shall be charged for each additional ounce of the weight of every such pamphlet, magazine, matter, or thing, which may be transmitted through the mail, whatever be the distance the same may be transported; and any fractional excess of not less than one-half of an ounce, in the weight of any such matter or thing, above one or more ounces, shall be charged for as if said excess amounted to a full ounce.

4. That the postmaster-general be, and he is hereby authorised, upon all mail routes over or upon which the amount of matter usually transported, or which may be offered or deposited in the post-office or post-offices for transportation, is or may become so great as to threaten materially to retard the progress, or endanger the security of the letter mail, or to cause any considerable augmentation of the cost of transporting the whole mail at the present rate of speed, to provide for the separate and more secure conveyance of the letter mail, at a speed at least equal to that at which the mail is now transported over such route, taking care to allow in no case of any greater delay in the transportation of the other matters and things to be transported in the mail on any such route, than may appear absolutely necessary, regard being had to the cost of expediting its transportation, and the means at his disposal, or under his control for effecting the same.

7. That the Act of Congress, entitled "An Act authorising the governors of the several states to transmit by mail certain books and documents," approved June the thirtieth, one thousand eight hundred and thirty-four, shall remain and continue in full force, any thing hereinbefore to the contrary notwithstanding: and the members of Congress, the delegates from territories, the secretary of the Senate, and the clerk of the House of Representatives, shall be, and they are

hereby authorised to transmit, free of postage, to any post-office within the United States, or the territories thereof, any documents which have been or may be printed by order of either house of Congress, any thing in this law to the contrary notwithstanding.

8. That each member of the Senate, each member of the House of Representatives, and each delegate from a territory of the United States, the secretary of the Senate, and the clerk of the House of Representatives may, during each session of Congress, and for a period of thirty days before the commencement, and thirty days after the end of each and every session of Congress, receive through the mail, free of postage, any letter, newspaper, or packet, not exceeding two ounces in weight; and all postage charged upon any letters, packages, petitions, memorials, or other matters or things received during any session of Congress, by any senator, member, or delegate of the House of Representatives, touching his official or legislative duties, by reason of any excess of weight above two ounces, of the matter or thing so received, shall be paid out of the contingent fund of the house of which the person receiving the same may be a member. And they shall have the right to frank written letters from themselves during the whole year, as now authorised by law.

9. That it shall not be lawful for any person or persons to establish any private express or expresses, for the conveyance, nor in any manner cause to be conveyed, or provide for the conveyance or transportation, by regular trips, or at stated periods or intervals, from one city, town, or other place, to any other city, town, or place in the United States, between, and from, and to which cities, towns, or other places, the United States mail is regularly transported, under the authority of the post-office department, of any letters, packets, or packages of letters, or other matter properly transmittable in the United States mail, except newspapers, pamphlets, magazines, and periodicals; and each and every person offending against this provision, or aiding or assisting therein, or acting as such private express, shall, for each time any letter or letters, packet or packages, or other matter properly transmittable by mail, except newspapers, pamphlets, magazines, and periodicals, shall, or may be, by him, her, or them, or through his, her, or their means or instrumentality, in whole or in part, conveyed or transported, contrary to the true intent, spirit, and meaning of this section, forfeit and pay the sum of one hundred and fifty dollars.

NEW YORK POST-OFFICE.

The North Mail, *via* Albany, Canandaigua, Rochester, and Buffalo, will be closed daily at..... 6 a. m. and 3½ p. m.

This Mail includes the Province of Canada.

The Mail on the West side of the Hudson, *via* Hackensack, Ramapo Works, Esopus, New Baltimore, and the Counties of Tompkins, Chemung, Tioga, Steuben, &c., closes daily at..... 6 a. m.

The Mail for offices bordering on the West side of the Hudson river, closes daily at..... 6 a. m. and 3½ p. m.

The Mail for Yonkers, Sing Sing, Fishkill, and all the offices on the East side of the river closes daily at

6 a. m. and 3½ p. m.

The Eastern steamboat Mail for New Haven, Hartford, &c., closes daily, except Sundays, at..... 5½ a. m.

The Mail for Boston, *via* Long Island Railroad, closes daily, except Sundays, at..... 6 a. m.

The steamboat Mail for Boston, *via* Stonington and Providence, closes daily at..... 4 p. m.

The steamboat Mail, for Boston, *via* Norwich and Worcester, closes daily at..... 3 p. m.

The Eastern land Mail, *via* Westchester, Norwalk, &c., to

New Haven, closes daily (except Sunday, for which day it is closed at 9 p. m. Saturday, and leaves this city at 10 a. m. Sunday) at..... 6 a. m.

The Mail, *via* White Plains, Bedford, and Ridgefield, to Danbury, Conn., closes daily, except Sundays, at 7 a. m.

The great Southern Mail, including the Mail for the Western States, closes daily at..... 7½ a. m.

Southern way Mail, which supplies the offices in New Jersey, including Philadelphia, Baltimore, and Washington City, closes at..... 7½ a. m. and 3½ p. m.

Mails for Brooklyn, close daily at..... 7 a. m. and 2 p. m.

Mails for Jamaica, Oyster Bay, Hempstead, &c., on Long Island, close daily at..... 6 a. m.

The Mails for other places on Long Island, close on Tuesday, Thursday, and Saturday, at..... 6 a. m.

The Mail for Flushing, *via* Williamsburg, closes daily, except Sunday, at..... 9 a. m.

The Mail for Staten Island closes daily, except Sunday, at..... 9 a. m.

The Mail, *via* Bridgeport and Housatonic Railroad, is closed daily, except Sundays, at..... 1 p. m.

CHAPTER XXX.

TRANSATLANTIC NAVIGATION.

WE were among the first who advocated the establishing a communication by steam power across the Atlantic. We urged the attempt on great public grounds.* But not only the prejudices of the public were against the probability of navigating the Atlantic by steam power—but the project was haughtily scorned by some legislators who then did, and now do, consider themselves no mean statesmen.

When we consider the progress of navigation from the period when the Dutch

* See Macgregor's *British America*, vol. xi., chap. ii., on Transatlantic Navigation.

possessed New York,—when we reflect upon the wonderfully increased intercourse between the United Kingdom and the United States,—and when we estimate the comparatively speaking limitation of the distance, by calculating the time required now, with that occupied formerly, in passing to and fro between both countries,—it would be rash and hazardous to give an absolute opinion on the future elements, rapidity and extension of navigable power. It was but late in the world's history, when a Dutch ship performed the voyage, by leaving Rotterdam or Amsterdam in the spring of one year—sailing only during the day, and furling her sails and laying-to during the night,—and on reaching New York, then called New Amsterdam, this ship was discharged, unrigged, and laid up for the winter. On the following spring, this ship was rigged, her condition examined and repaired, then laden with wood, fish, or furs, and then made her homeward voyage during the summer, as slowly as her outward voyage was performed the preceding year.

The voyage was afterwards performed out and home during the same year. English ships then made two voyages during the year; and growing bolder, three voyages to and from America were made annually by the same ship. Those splendid vessels, the Liverpool and New York line of sailing-packets, were then established, and the intercourse between Europe and America astonished the world. Steam-ships are now seemingly about supplanting those sailing-ships, at least in the carriage of passengers.

The space between the Old and New World ceases to be calculated by miles and leagues; days and hours measure the distance. Liverpool and Halifax are brought within ten days, and Liverpool and Boston within twelve days of each other.

It is by means of this powerful agency,—of this rapid, mighty, and certain intercourse, that all possible good may be extended from, or all possible evil inflicted by, one country to, or upon, the other. The era of the successful establishment of steam navigation has been the most important to trade, intercourse, and consequently of extending knowledge and civilisation, that has occurred since the discovery of America, and, since the first voyage was accomplished by sea from Europe to India.* Knowledge and civilisation have advanced, or retrograded, according to the extent to which the intercourse between individuals and nations has been rendered either easy, quick, and frequent,—or difficult, tardy, and of rare occurrence. That means, which shall bring nations, and kindred,

* In a work long out of print published about ten years ago, and containing sketches relative to men and things, chiefly on the continent of Europe, we find the following passage:

“FIRE! WATER! STEAM! what can *philosophy* have to do with *these*, or *these* with *philosophy*? Undoubtedly, Yes. Steam in the first place diminishes one of the heaviest pains and penalties inflicted on the race of original sinning Adam,—‘*By the sweat of thy brow shalt thou eat thy bread* ;’ for while it lessens the toils, it multiplies the productions that are useful to mankind. By its gain upon time, over distance, it reduces the space which separates countries, and by the same rule it lengthens life, by calculating its duration according to the number of acts that mark our existence, and not by the days which compose our physical sojourn.

“By rendering the intercourse of nations easy, cheap, frequent, and certain,—by its multiplying and diffusing the productions of the press,—by its interchanging readily the ideas of mankind, and the commodities of the earth, it forms the most effectual means of diffusing knowledge, dispelling fanaticism, subverting despotism, and repressing anarchy.”—*My Note Book*. By J. MACGREGOR. London, 1835.

and people into the nearest social intercourse, will be the sure and irresistible power destined to civilise the universe: by the facility with which intelligence, and consequently instruction, will be conveyed, by sea and by land, over every part of the world, and by the rapidity and ease with which individuals of one nation may be made acquainted with those of all others.

Steam-vessels now ply along the coasts of Africa, in the Chinese seas, and along the shores and rivers of New Holland.

The steam-ships now employed between London and Scotland are of enormous power and magnitude. So are those which run between the Mersey and Clyde, and between the two latter rivers and the several ports of Ireland.

The fleet of the General Steam Navigation Company maintains a constant intercourse with the ports of France, Holland, and Germany, as well as in the coasting trade of the British channel.

The states of continental Europe are also advancing in the acquisition of steam power. France, Austria, and Russia, are the foremost, in the number of their steam-ships. Austria excels all the states of the continent in merchant steam-ships. France and Russia in steam-ships of war. The Italian states, especially Naples and Tuscany, possess several well built and well navigated steam-ships. Prussia and Holland, on the Rhine, contribute greatly to the facility of intercourse. Belgium has made attempts, at great expense, to establish a transatlantic line of steam-packets. The attempt has failed. The Hanse Towns, Denmark, and Sweden, also possess steam-ships, but only on a comparatively small scale. Greece and Turkey are far behind other countries in the possession of steam-vessels. The Greeks, were their country and commerce in a flourishing condition, would, no doubt, manage steam-ships as ably as they certainly have their sailing vessels. The Turks have been clumsy mariners, and their few steam-vessels are wretchedly managed. Of all orientalists, the ruler of Egypt has made an extraordinary advance in the acquisition of powerful steam-ships.

In 1814, there was but one steamboat belonging to the British empire. During thirty years the number has increased to about 1000 British steam-boats which are now navigating all parts of the world.

In 1845, the British government employs a magnificent fleet of steam-ships, managed by, and belonging to, a private association, which sail, *semi-monthly* for eight, and *monthly* for four, months in the year, between Liverpool, Halifax, and Boston. From Boston, the great means of intercourse, by steamboats and railroads, diverges to all parts of North America—extending to the furthestmost of the great lakes, and up and down the navigable rivers, flowing from the Rocky Mountains. Iron is made to swim, in the form of a ship (the Great Britain) exceeding 3600 tons, burden, impelled forward from Liverpool to New York, against the currents, raging storms, and seas of the Atlantic, by an invisible power, moved by the resistless force of fire causing the expansion of water.

Another splendid fleet of steam-ships, belonging also to a private company,

are employed by the government to maintain a monthly intercourse between the United Kingdom, by Southampton, and all the islands of the West Indies and the states of Mexico and South America.

A third and mighty fleet, belonging to a great company, and employed by the government, sails monthly from Southampton to the European Peninsula, and by way of Gibraltar to Malta and Alexandria, with a branch to the Levant and Constantinople. The same company conveys the government mails, and passengers, by three of the most powerful steam-ships in the world, from Suez, down the Red Sea to Ceylon, Madras, and Calcutta; and that company has contracted to extend the established chain between Southampton and India, to Singapore and the Chinese empire, by the employment of several powerful steam-ships, nearly all constructed. This steam line between England and China is now complete, by which we have received an English newspaper printed at Hong Kong only fifty-six days before our having read it in London.

A British company has for some years established a line of steamers along the western coasts of South America; and the Hudson Bay Company have a steamship on the western coast of North America. The East India Company employs one steamship in conveying mails between Suez and Bombay; and several steamvessels are employed in India, and others in the eastern or Chinese seas, by the British government, as vessels of war.

France has projected four great lines of Transatlantic steam-ships—when they will, or whether they will, be established, we have neither the power, nor the temerity to decide.* We cannot discover any natural obstacle in regard to France and America, to prevent French Transatlantic ships competing with those of England; but, according to our mere instinctive judgment, we are inclined to the belief that the great connecting line of intercourse, between Europe and America, will continue to be maintained direct, between ports in the United Kingdom, and ports

* The following appeared as the programme of the projected line of French steam-ships.

First great line—from Havre to New York. Four steam-ships are to be placed on this line; the departures are to take place once a fortnight. Fifteen days are allowed for each passage, and ten days at New York—in all, forty days. Twenty days are to be allowed to each vessel at Cherbourg, between every voyage, to rest the crew, and repair the vessel and engines.

Second great line—from Bordeaux to Martinique. Three steamers are to be placed on this line; the departures are to take place once a month. Two days are allowed for the passage from Bordeaux to Corunna, and ten hours' stay there; five days twelve hours for the passage from Corunna to the Azores, and one day's stay there; twelve days sixteen hours for the passage from the Azores to Martinique, the steamers to remain ten days at Martinique. Twenty days are allowed for the return passage from Martinique to Bordeaux—in all, forty days' sailing, and eleven days and a half stoppages. Thirty-seven days are allowed between every voyage, at Rochefort or Bordeaux, for repairs and stoppages.
